Executive Summary

A Long-Range Facility Master Plan (LRFMP) is an essential tool for reviewing a school district's facilities, determining recommended improvements and exploring available resources. The LRFMP is also an important district tool to identify facility needs related to the educational program, project student enrollment, calculate classroom capacity, assess facility conditions, identify improvements needed, and identify funding options and opportunities.

Highlights and summary of the LRFMP include:

- ✚ Current demographic trends strongly indicate that the District will be subject to a continuing decline in enrollment during the next ten years – absent significant residential development in the region. The District has lost an average of 263 students per year over the past eight years. The past year witnessed a loss of over 500 students from 2015-16. This is the result of a combination of factors including declining births, an aging population and losses of students between kindergarten and first grade. In addition, limited residential population has not been significant enough to backfill these student losses.
- ✚ There is limited residential development moving forward. Currently, residential development of approximately 1,062 units is anticipated to produce approximately 148 new students through the projection horizon.
- ✚ While there has been a decline in OUSD's enrollment, there has been an increase in charter school enrollment in the region. This decline in enrollment and a similar increase in the charter school population should be researched to determine whether any district involvement and intervention is necessary or appropriate.
- ✚ The District has sufficient capacity to accommodate an influx of new students should there be a surge in residential development.
- ✚ The capacity analysis counted all spaces that met the three criteria pursuant to the California Department of Education's (CDE) "Classroom Definition Policy" (March 19, 2009): 1) larger than 700 square feet in size; 2) built as a classroom; and, 3) used as a teaching station for the last 5 years.
- ✚ A comparison of three capacity standards compared to the most current enrollment data is illustrated.
- ✚ Comparative information regarding both classroom counts as well as a "Capacity vs. Enrollment" charts are included.
- ✚ Using the state's eligibility standards, the District has 747 permanent and 242 portable classrooms for a total of 989 classrooms.
- ✚ The capacity of these classrooms has been calculated as 23,852 students.

- ✚ Educational Specifications ("Ed Specs") were developed as part of the process of preparing a Facilities Master Plan.
- ✚ Educational Specifications are intended to be a picture of the educational needs of the various spaces found at a school site.
- ✚ The Educational Specifications list the characteristics of a facility on a space by space basis. The intent is to align the needs of 21st Century learners and develop guidelines that support student collaboration, creativity and communication. The list below delineates those items that the District believes all classrooms will need at Oceanside Unified School District as it prepares students for college and career readiness. Key specifications include:
 - Flexibility- *accommodate changes for the next 25 years*
 - Extended Classrooms- *nothing is inactive*
 - Shared Spaces- *collaborative learning*
 - Outdoor Learning- *every area invites learning*
 - Maintainability- *key is standardization*
 - Sustainability- *reduce future operational expenses*
 - Safety and Security- *#1 concern of stakeholders*
- ✚ A Superintendent's Facility Advisory Committee (SFAC) was used to develop and prioritize critical facility projects that would improve the educational facilities of the District. A final count of all projects identified as facility projects yielded a total of 706 total projects that were ranked. Out of those 706 projects, 78 were identified as having the highest priority.
- ✚ The District has approximately \$25.5 Million of available resources which includes \$20.5 Million of available Building Funds and \$1.1 Million of available Prop. 39 Funds and \$4.0 Million of Capital Facilities Funds.
- ✚ Looking forward, it is recommended that the OUSD Superintendent and Board of Education:
 - Finalize the list of facility improvements identified in the LRFMP based on OUSD priorities and potential funding;
 - Authorize the development of a facility project implementation plan, to include phasing of projects, and develop a schedule of activities;
 - Authorize the applications be completed and filed with the Office of Public School Construction (OPSC) and the State Allocation Board (SAB) and monitor events at the state level which would position the OUSD to maximize local funding;

- Periodically review and update the educational specification, enrollment projections, classroom inventories, condition assessment of facilities, and funding options;
- Utilize the LRFMP to continue to develop and improve the teaching and learning environment and determine the direction for improving the OUSD's real estate and facility assets.

EH&A appreciates the opportunity to be of service to the Oceanside Unified School District. The District is commended for taking the time and effort to develop the LRFMP. The diligent effort of the staff and the Board of Education is evident in the efforts the OUSD has expended in focusing on school facilities.

Introduction

Oceanside Unified School District (OUSD) is located approximately forty miles north of the city of San Diego and serves the city of Oceanside. The District covers approximately sixty-sixty square miles. It is bordered on the west along the Pacific Ocean, south on Vista Way, east on College Boulevard, and along the north at Marine Corps Base Camp Pendleton.

As of the 2016-17 school year, the District operates twenty-three school sites serving nearly 21,000 students:

Sixteen Elementary Schools
Four Middle Schools
Two Comprehensive High Schools
One Alternative High School

The Oceanside Unified School District (OUSD) is one of forty-two public school districts in San Diego County. The District consists of twenty-three school sites – sixteen elementary schools, four middle schools, two comprehensive high schools (Oceanside High School and El Camino High School), and one alternative high school. OUSD is home to nearly 21,000 students in the Oceanside community.

The diverse student population includes about 4,000 students from Marine Corps Base Camp Pendleton. The District's three largest student populations include Hispanic students (55%), Caucasian students (27%) and African American students (8%).

OUSD employs nearly 3,100 individuals, with nearly 1,900 employees falling under the category of certificated personnel (teachers and administrators). Geographically, the District covers roughly sixty-sixty square miles in the north county.

The mission of the OUSD is to ensure that every student graduates and has the ability to succeed in the global community. The preliminary general operating fund budget for the 2008-09 school year is \$168 million, and the per pupil expenditure is \$8,200.

In June 2008, Oceanside voters overwhelmingly approved Proposition H (71%), a \$195 million school bond measure. The monies generated from this bond will allow the District to continue the modernization process for sixteen campuses, a renovation program that began with the passing of Proposition G (69%) in 2000, a \$125 million measure.

OUSD is committed to providing a rigorous curriculum and enriching extracurricular activities to help guide our students to bright futures. The District offers several challenging programs at the elementary and secondary levels.

District History

While information is sketchy, it appears the first school in what is now Oceanside was opened in 1880. This was eight years prior to the incorporation of the city. Although not much is known, it is reported to have housed high school aged students. Quite appropriately, it was named Oceanside High School. That the building was allegedly somewhat rundown might be inferred from the fact that when the school closed in 1883, the building was turned into a barn.

The grammar school was built around 1888 on the corner of Topeka and Horne and was originally called Oceanside Grammar School, but came to be known as Horne Street School. Available records indicate that it may have been the first permanent school structure in Oceanside. The tentativeness of the assertion that it was the first school stems from indications that the South Oceanside Grammar School, located at the corner of Horne and Cassidy, was also built in the 1880's. Neither school, however, was in the same district, despite their proximity to one another.

By 1890, another district was formed, the Libby School District, and it conducted classes in a rented house. Constructed in 1893, the Libby School personified the idea of the "Little Red School House" so familiar to all of us. It was a one-room school with one teacher for sixteen students in grades one through eight. By contrast, Oceanside Grammar School was a two-story frame structure with 100 students among nine grade levels in three rooms.

With a small but growing population, a need for a school was filled when Samuel M. Tyson built a "temporary school house" located near Second and Hill (Mission and Coast Highway). In August of 1885, it was reported that the school opened with 19 children in attendance. In October of 1886, Matthew Spencer delivered lumber to Horne Street for the new schoolhouse. It was a two-story structure with a bell tower. Records are limited, but it seems that the school building was completed by the Fall of 1887.

In 1906, a high school district was formed to make up the Oceanside-Carlsbad Union High School; they included South Oceanside, Oceanside, Carlsbad, San Luis Rey, Libby, Calavera, River, Vista, Delpy and Encinitas. High school was taught on the second floor of the school house, with elementary classes taught below. The first graduation for the Oceanside-Carlsbad Union High School took place in 1909 and was held at the Mildred Opera House.

A bond issue was passed in 1913 and provided funds to build a separate high school building. The cornerstone was laid on May 3, 1913 and the building was completed by September. Fifty-five students and a staff of four began the school year in the new high school which contained four classrooms, a study hall, and an office. In 1920, a science building was added to the campus at a cost of \$17,500.

In 1940, there were just over 600 students enrolled in Oceanside schools. That number nearly doubled by 1946 and classrooms were bursting at the seams.

In August of 2007, the new Louise Foussat Elementary School was opened on Pala Road in Oceanside. The school was named after Louise Munoa Foussat, who was born here in 1908 and was part Luiseno Indian. She was proud of her heritage and was a historian in her own right, sharing stories with many schoolchildren over the decades.

Although Louise did not live to see the school that bears her name, the city recognizes her birthday, August 25th as Louise Foussat Day.

Educational Specifications

Written collaboratively by the Educational Specifications Committee in January 2017. Members of the Ed Specs Committee were Matt Evans, Josh Thibodeaux, David Fogliatti, Tiffany Cooper-Ortega, Doug Kriedeman, Erik Mateljan and Deputy Superintendent Reggie Thompkins. Dr. Jeffrey Felix from Eric Hall & Associates moderated the discussions.

Form follows function. To build school facilities that meet the needs of students and educators, designers must understand the needs of their clients. With dynamic shifts altering the K-12 instructional landscape, designing schools that look just like those we built in the past will not meet the needs of our present and future students. Many of the educational trends and facility objectives identified in this document are not unique to Oceanside, but the issues described herein are of particular interest here.

This document is intended to paint the broad-brush strokes of the District's intent for its facilities. Architects and engineers will need much more specific guidance from the District to make key decisions about building design and to produce plans and specifications. Those details will be encompassed in the District's Design Guidelines, which are updated more frequently than this document.

Educational Trends

The history of education is replete with examples of educational trends that have waxed and waned over the years. During the open school's movement of the seventies, the District built two schools on that model that were almost immediately modified substantially to mitigate their deficiencies. Both have subsequently been demolished. The challenge when evaluating educational trends is to distinguish the idea du jour from a lasting shift in direction.

The trends identified here have been observable for several years and are based on broad societal trends that are more likely to progress than to diminish. There are other identifiable trends in education both broadly as well as in the District, but they are unlikely to have an appreciable impact on school facilities.

Personalization

There is a persistent trend towards tailoring both educational programs and learning experiences to suit each individual student, and for students to have voice and choice in determining both what they learn and how they learn it. Personalized learning is distinct from individualized learning, in which students share the same learning goals but progress through the curriculum at their own pace. And differentiated instruction, in which students also share learning goals but receive instruction that is tailored to their learning needs, is a similar but distinct concept.

Personalized learning is an instructional approach that encompasses both differentiation and individualization, but is also flexible in content or theme to match the specific interests and prior experiences of learners. It leverages all the different things people have in their individualized

inventory that adds value to their learning experience while still considering their prior motivation or unique interest.

This model includes a strong emphasis on parental involvement, more one-on-one teacher and student interaction, attention to differences in learning styles, student-driven participation in developing the learning process, technology access, varied learning environments, teacher and parent development programs, and choices in curriculum programs.

Technology is just one factor that can enhance personalized learning, but many educators feel technology is the essence of the opportunity to provide a much more personalized learning environment for students. Students have access to traditional learning resources like books and hands-on materials, and time-honored support from people like teachers, parents, mentors, coaches, and schoolmates. But, critically, they have ubiquitous access to technology, which allows them to connect to learning communities, information management and communication tools, personal learning networks, information and data, expertise and authoritative sources, online tutoring and guided sources tailored to their needs, knowledge-building tools, and peers with common interests.

In the classroom, this will be manifested with reduced emphasis on direct, whole-class instruction and a corresponding increase in individual and small group collaborative work. In a campus context, personalization may take the form of multiple pathways across grade levels and with increasing specificity at higher grades.

Collaboration

Personalized learning is a highly social experience. Collaboration plays a large role in the personalized learning model. When students collaborate on a team, they learn to assess their own strengths, and learn from their peers in areas where they have weaknesses.

Classrooms that are conducive to collaborative learning feature furniture that is mobile and easy to create small groups, such as wheeled furniture, bean bag chairs, yoga balls, or tall tables intended for standing. These “active classrooms” are relaxed environments replacing the standard, formalized setting. Active classrooms may use technology in ways conducive to student participation and discussion, and many are simply arranged so that desks are set up to allow students to sit and work in small groups.

Technology that supports small group interaction and extends virtual collaboration tools into the physical world is key to fostering collaborative classrooms. Mid-sized displays suitable for viewing by 3-8 students enable idea-sharing using on-screen collaborative tools. Writeable walls or even windows can serve as small group collaboration venues as well.

We are increasingly asking students to collaborate in groups of various sizes. Students learn valuable interaction skills, practice their communication skills, and learn from each other. School facilities designed to enable student collaboration can empower teachers to create collaborative learning experiences.

Authenticity

An increased emphasis on preparing students for college and careers is beginning to have a profound effect on K-12 education. Educators are discovering that creating learning experiences that require real-world application of knowledge and skills can eliminate students' age-old question of "Why do we need to know this?"

One manifestation of this trend is an effort to make the school workplace more closely reflect the career workplace, with both individual and collaboration workspaces and tools. In schools this is typically applied in the context of generalized workspaces like desks, meeting areas, or labs. Learning spaces that mimic workplaces help students make the mental leap from their current learning to its practical application in a future career and acclimate them to professional work environments.

Another expression of the authentic learning trend is a renewed interest in Project-Based Learning (PBL). Whatever we call them, PBL and its cousins, Problem-Based, Challenge-Based, and Inquiry-Based Learning share a common thread of acquiring knowledge and skills within the context of practical application. PBL works hand in glove with the current STEM or STEAM movement but is viable in all curricular areas. Learning experiences that require application of knowledge and skills motivate students, deepen their understanding, and develop problem-solving and critical thinking skills.

Two general types of learning space needs to emerge from this trend:

- "Soft" spaces with carpeted floors and sound-absorbent finishes typical of office settings.
- "Hard" spaces better suited to messy activities typical of industrial settings. Traditionally these have been limited to science labs and wood or auto shops, but "makerspaces" belong here as well. These spaces require storage space suitable for materials and student projects.

Mobile Technology

Handheld technology is fundamentally changing the way people access factual information. While this trend will inevitably alter every aspect of human endeavor, technology adoption in K-12 classrooms is currently in transition as schools struggle to find resources to acquire and support technology and the concomitant migration to digital content and systems. Nevertheless, today's students face a future in which they and everyone around them will have a supercomputer with an artificial intelligence assistant in their pocket. With access to information universal, the ability to find, evaluate and apply information will become increasingly valuable.

Mobile technology in schools present a number of significant facility demands:

- Network Infrastructure – Wireless capacity must be able to support both high density (many devices close together) and high bandwidth (e.g. video) usage simultaneously across an entire campus. Network backbones must be adequate to support voluminous aggregated traffic from the classroom to the cloud. The early generations of fiber optic cable installed in schools are proving inadequate for the current and future bandwidth

demands of voracious, multiplying mobile devices. As instructional, administrative, and life/safety functions increasingly rely on network availability, power protection for the network becomes more critical.

- Power – While the plug load of mobile devices is negligible compared to desktop computers, they do require periodic charging. Classrooms and shared spaces alike would benefit from student-accessible charging areas with multiple outlets.
- Secure Storage – Devices that don't go home with students must be secured after school hours. As digital content replaces print curriculum in intermediate and secondary classrooms, device and accessory storage may replace textbook storage.

Distance Learning

Blended learning and online courses have been embraced in higher education and adoption in K-12 is emerging. Online learning opportunities represent a spectrum from watching an instructional YouTube or Khan Academy video to a teacher-led, fully synchronous, video-enabled virtual classroom with infinite permutations in between.

Previous generations of video-enabled distance learning required expensive equipment, dedicated telecommunications lines and copious technical support. Skype and FaceTime now provide inexpensive and widely available remote interaction, and numerous commercial services provide webinar-type live sessions. Strong, low-latency networks with plentiful bandwidth are required for live video interaction, but use of these tools is increasingly commonplace.

Fully online courses are currently hindered by K-12 funding models based on physical attendance. However, a number of charter schools are leveraging technology to provide curriculum and virtual learning experiences, both in asynchronous and blended models. Virtual schools and online-supported home schools are an increasingly viable option and have already begun to lure families away from the District in significant numbers.

Once legal obstacles have been removed it may be feasible for school districts to offer fully online, synchronous or even asynchronous courses to their students. Coupled with the potential for college-style courses that don't meet daily, this could significantly reduce the need for classroom facilities at the secondary level. The District's Academic Acceleration and Recovery Centers have operated on alternative schedules and calendars for several years, supporting more students per classroom than traditional paradigms.

A high school with a non-traditional schedule may have students with open periods in their schedules, as is typical with college students. In these scenarios students need places on campus to hang out and work productively, either individually or in groups, between classes. These spaces will require multiple seating options, robust Wi-Fi, access to electrical outlets for device charging, and access to the same collaboration technologies they have in their classrooms.

Support Services

The District's ambitious Oceanside Promise initiative aims to address not only the academic needs of our students, but their social/emotional needs and the needs of their families as well. At the same time, the District provides an increasing array of services to our students with special needs. With the increase of both District staff and staff of the District's community partners, there is increasing demand for office and small group interaction space on our campuses. Many staff members need isolated space to work one on one with students either to reduce distractions or to protect student privacy. While classrooms double as meeting spaces after school, during the school day meeting space can be hard to find.

For staff who only occasionally need private space, establishing office space clusters with a shared private conference room would be more cost-effective than attempting to provide private spaces for every staff member. School designs should be re-programmed to account for the increase in staff and pseudo-staff present on our campuses.

Working spaces for itinerant staff and non-clerical support staff should not be neglected. Administrative spaces for custodians should be provided. Technical support staff need space to work and store equipment as well as occasional access to secure pre-deployment or re-deployment equipment staging areas.

Facility Objectives

Flexibility

We are at a time of dynamic change in public education, with technology disrupting traditional instructional practices and providing intriguing opportunities. We would be naïve to think that we know precisely how we'll want to use our classrooms 15 or 20 years from now. The pragmatic response to such uncertainty is to create learning spaces that can be configured to accommodate a range of instructional modes. Classroom design should be pedagogy-agnostic, supporting the full gamut of learning modes without presuming a particular preference.

In practice, this will result in a less built-in cabinetry in classrooms so that teachers rather than designers will be making decisions about room configuration. Furniture that can quickly be moved by students will accommodate rapid shifts between learning modes during class. Multi-function walls are appropriate when they are able to support instructional materials or can be written or projected upon thus enabling teachers to make any wall into the "front" of the room for direct, whole class instruction. Some built-in cabinetry will be necessary for storage and to support sinks but cabinetry should have multi-functional surfaces where feasible.

Building services like lighting and user-accessible power and lighting should support flexible room configuration. Power and data outlets should be available at multiple points on each wall as well as in at least one accessible ceiling location.

Lifetime expectancies for school buildings are long; it is typically 25 years or more from a school's original construction before it will be modernized, and even longer before it will be replaced. The

ability to modify buildings inexpensively to suit future needs can prolong the useful life of school buildings. Designing for future capacity and location expansion in power, signal, and plumbing infrastructure can help future-proof buildings, facilitating less expensive solutions for future, unknown needs.

Extended Classrooms

With students working individually and in small groups, a classroom that can be extended beyond the customary four walls provides additional flexibility. This can be accomplished with visual and/or physical access to nearby secure spaces so that students can be outside the classroom but still under the teacher's supervision. These could be fenced outdoor areas, enclosed courtyards, or internal circulation spaces.

Schools have experimented with accordion walls and other solutions for subdividing space for many years. There are tradeoffs for the flexibility afforded by moveable walls, however. Wall finishes are often limited and infrastructure services (power, data, water, storage) cannot be provided on mobile walls. These tradeoffs might be more acceptable for a single classroom wall if that wall met the other desired criteria like having a writeable surface. A moveable wall made of glass, for example, could provide visibility to another space and be written upon with dry erase markers.

Managing sound is a key consideration for classroom design. Extended classrooms must still be able to mitigate outdoor noise and prevent their own noisy activities from disturbing their neighbors. One advantage of the extended classroom is the ability to separate activities requiring quiet from more active learning modes.

Shared Spaces

Extended classrooms benefit from adjacent secure spaces that allow groups of students to spread out to accommodate simultaneous, diverse learning activities. These can be outside spaces adjacent to classrooms that are fenced or enclosed by buildings. Interior spaces can serve for circulation and as extended classroom space as well.

The trend towards authentic learning has increased demand for shared spaces with finishes and services appropriate for messy, hands-on, project-building. “Makerlabs” are part art room, part woodshop, and part tech lab. With more rugged classrooms or access to secure outdoor learning spaces, the demand for dedicated making spaces could diminish, but it seems likely that demand for this type of specialized space will persist and even grow as the authenticity trend builds momentum.

The trend towards increased collaboration extends to the adults in a school as well. Classrooms double as meeting rooms after school hours, but during school hours there is an increasing need for meeting spaces for small groups. These spaces require the same collaboration features as in classrooms.

Private settings for one-on-one instruction (e.g. speech therapy) or counseling are increasingly in demand. In schools without small office spaces, at times entire classrooms are dedicated for this purpose, some occupied by a single service provider. This represents an inefficient use of space that could be prevented by providing additional small offices.

Outdoor Learning Spaces

Oceanside enjoys an ideal climate with prevailing onshore winds from the Pacific Ocean typically moderating temperatures within a comfortable range. Unlike in many parts of the country, it's practical to be outdoors most days in this area. This provides an opportunity to take learning activities outside, in areas immediately adjacent either to classrooms or in other areas of campus designed for this purpose.

One visible manifestation of the authenticity trend on campuses is the prevalence of gardens as learning laboratories. In addition to the link to science curriculum, students learn where food comes from and all aspects of agriculture. Some campuses have obvious garden locations but others have less suitable options. Ideally gardens should be located on level grades away from classrooms with access to water and power. Fenced locations with securable access from off campus facilitate community gardens. Care should be taken to preserve the "curb appeal" of campuses by locating gardens in rear areas of campuses or in areas shielded by building from public view.

The District has greenhouses on a few campuses and anticipates additional requests as funding allows and associated instructional programs mature. Greenhouses suitable for occupation by students must be safe and accessible and require water, power, and appropriate drainage. Locations for future potential greenhouses should be identified during campus design.

In recent years, there has been increased concern about protecting students from excessive sun exposure when they're outdoors. Trees require periodic maintenance but can provide excellent shade and mitigate the sterility of modern school facilities. Fabricated shade structures require less maintenance than trees but don't require decades to provide shade and are available in a wide range of materials and configurations.

Some schools have improvised outdoor classrooms in their garden areas, with mixed results. Providing for these areas in campus design will allow for provision of proper access, drainage, shade, and security. Outdoor classrooms can be as simple as benches or even rocks or log sections secured under shade trees. Many schools have interstitial spaces between classroom wings that are often hardscaped or planted with ornamental landscaping. Equipped with seating walls and/or concrete tables and shade, these areas represent opportunities for extended classroom spaces.

Maintainability

In California, capital funds for improving school facilities are separate from funds for school operations. With operational funds, perpetually scarce, building school facilities that are inexpensive to maintain is a high priority. The challenge for designers is to create productive schools with attractive learning spaces that are durable and low-maintenance.

Implementing standard finishes, fixtures and building systems across multiple projects can reduce maintenance costs and complexity and simplify decision-making in the design process. Standards allow maintenance personnel to stock replacement components and materials, speeding repair work.

Selecting durable, low-maintenance finishes help stretch limited custodial resources and ensure that learning spaces are always clean and ready for student use. Rooms serving our youngest students and spaces designated for messy activities, like makerspaces or science labs require attention to finishes.

Standardizing on particular types or brands of building systems like HVAC equipment, paging systems, or security systems can streamline building maintenance. Highly proprietary systems present significant risks if manufacturers disappear or are taken over by competitors. Open systems based on industry standards mitigate risk and are most likely to be supportable in future years.

Sustainability

In recent years, sustainability has been linked to green initiatives and practices. The District is certainly interested in reducing its carbon footprint, but it is also interested in reducing operational expenses to free up resources for its core business of teaching and learning. Building durable, high-quality facilities reduces wasteful re-construction and lengthens the useful lifetime of our campuses. Investing our capital resources to reduce future operational expenses is a prudent use of limited funds.

The District is working actively to reduce its energy usage. A behavior-based energy saving program has shown promising results in reducing waste by ensuring that energy-consuming devices are turned off when not in use. Proposition 39, approved by California voters in 2012, has provided funding for HVAC and lighting upgrades that will further reduce energy usage.

While only a few years ago, LED lighting was difficult to cost-justify due to high initial costs, efficiency improvements and market-driven cost reductions have changed that thinking. With even further efficiency improvements and cost reductions expected, LED lighting will be standard everywhere. Dimmable LED lights simplify Title 24 compliance and are now available in the full gamut of brightness and color temperature. LED lights have the added advantage of reducing or eliminating lamp and ballast replacement, saving valuable time for custodial and maintenance staff.

The District has implemented explicit daylight harvesting strategies in many of its buildings, installing its first solar tubes as early as 2004. Dimmable LEDs and Title 24 compliant lighting controls will maximize savings from daylight capture by lighting spaces only as needed.

While Oceanside's ideal climate keeps HVAC-related energy costs relatively low, they still constitute the lion's share of the District's energy bills. In recent years, the District has provided individual HVAC systems for each classroom. In our experience, the nominal efficiencies presented by package units serving multiple rooms are typically offset by the need to run them longer to accommodate the varied needs of the building's occupants. While the District is committed to providing occupants control of their environment, implementing smart thermostats that could be globally controlled by support technicians would further increase efficiencies and provide better service for occupants.

The state has an ambitious goal of making half of all government buildings, including schools, Zero Net Energy facilities by 2030. While still just a goal, this initiative is likely to transform into guidelines and eventually regulations. Efforts to reduce energy consumption in HVAC, lighting, and plug load will certainly help, but achieving zero net energy requires on-site energy generation. Now, solar is the only technology capable of providing sufficient energy to power a school site, and many schools have implemented solar energy systems. Most school solar consists of freestanding panels, often mounted over parking lots. Such systems placed in playgrounds or near classroom buildings could double as shade covers.

While solar has been growing in popularity for the last decade, in more recent years it is increasingly being paired with energy storage technology. The power generation profile of solar panels correlates well to the energy usage curve of schools throughout the day, but there are periods of high energy use outside of peak solar generation hours. Battery storage can bridge the gaps, providing a reliable energy source around the clock. The ability to store energy also allows owners to avoid the exorbitant charges associated with high power demand episodes, a practice known as peak shaving.

Safety and Security

The safety and well-being of our students and staff is always a top priority for the District. Recent concern about school shootings and intruders on campuses has prompted an effort to enhance security at our schools. School personnel need to be able to control access to classroom and play areas during school hours, preferably through a single point of access at the school office. Schools have expressed interest in technology-based solutions for tracking visitors while on campus.

The District recognizes that during non-school hours, our campuses represent important community resources, serving as de facto parks and playgrounds. However, uncontrolled access to classroom areas increases opportunities for vandalism and theft. Whenever feasible, classroom and administrative areas of campuses should be fenced off from playgrounds and field areas so that buildings can be secured after hours. Care must be taken to ensure that gates are sized appropriately to support rapid student egress from classroom areas to evacuation areas during emergencies.

While schools still conduct required fire drills to practice evacuation procedures, preventing and responding to active shooter scenarios is increasingly the focus of school safety efforts. Buildings that can be locked down quickly and without exposing occupants to danger provide peace of mind to students, staff, and parents. Windows that face unsecured areas should be placed high enough to prevent visibility into classrooms or include features that allow occupants to quickly prevent visibility from outside.

Demographics and Enrollment Projections

Data Collection

This demographic/enrollment study utilizes data derived from a number of sources. These sources include the following:

- ✚ The United States Census Bureau collects and retains both historical and current information on various topics, including detailed demographic information. Beginning with the 2010 U.S. Census, the Census Bureau started collecting data on a more granular level to include data specific to areas encompassed by school District boundaries; and in this case, the Oceanside Unified School District. At the same time, the Census also collects data by Zip Code Tabulation Areas (ZCTAs) which is particularly useful in obtaining information about housing and major industries. ZCTAs are statistical entities developed by the U.S. Census Bureau for tabulating summary statistics. These were introduced with Census 2000 and have continued with Census 2010 and beyond. ZCTAs are generalized area representations of the United States Postal Service (USPS) ZIP code service areas; but are not the same as ZIP codes.
- ✚ Statewide enrollment data provided by the State of California Department of Finance Demographics Research Unit.
- ✚ The California Department of Public Health (CDPH) provided information both current and historical on births by ZCTA.
- ✚ The California Longitudinal Pupil Achievement Data System (CALPADS) data and statistics were collected and used to provide other enrollment data and highlight trends.
- ✚ The San Diego Association of Governments (SANDAG) provided demographic information related specifically to the area defined as the boundary for the Oceanside Unified School District.
- ✚ The City of Oceanside and the County of San Diego's Planning Departments provided detailed information on projected residential development within the District's boundaries and "sphere of influence."

Demographics

Population

The District is located in the northern coastal portion of San Diego County. The District is bordered to the north by the Fallbrook Elementary School District and the Fallbrook Union High School District; to the south by both the Carlsbad and Vista Unified School Districts; and to the east by both Bonsall as well as Vista Unified School Districts. In 2010, the population of the area represented by the OUSD boundary was 134,638. The same OUSD boundary, as identified in the American Community Survey (ACS) for 2015 estimates the population at 137,112. This would represent an increase of 2,474 or 1.9%. Given the "margin of error" implicit within ACS estimates, it would be safe to say that the population in the OUSD "region" has remained relatively flat. This

increase compares to a 6.6% population growth for all of San Diego County over the same five-year period.

Age Distribution

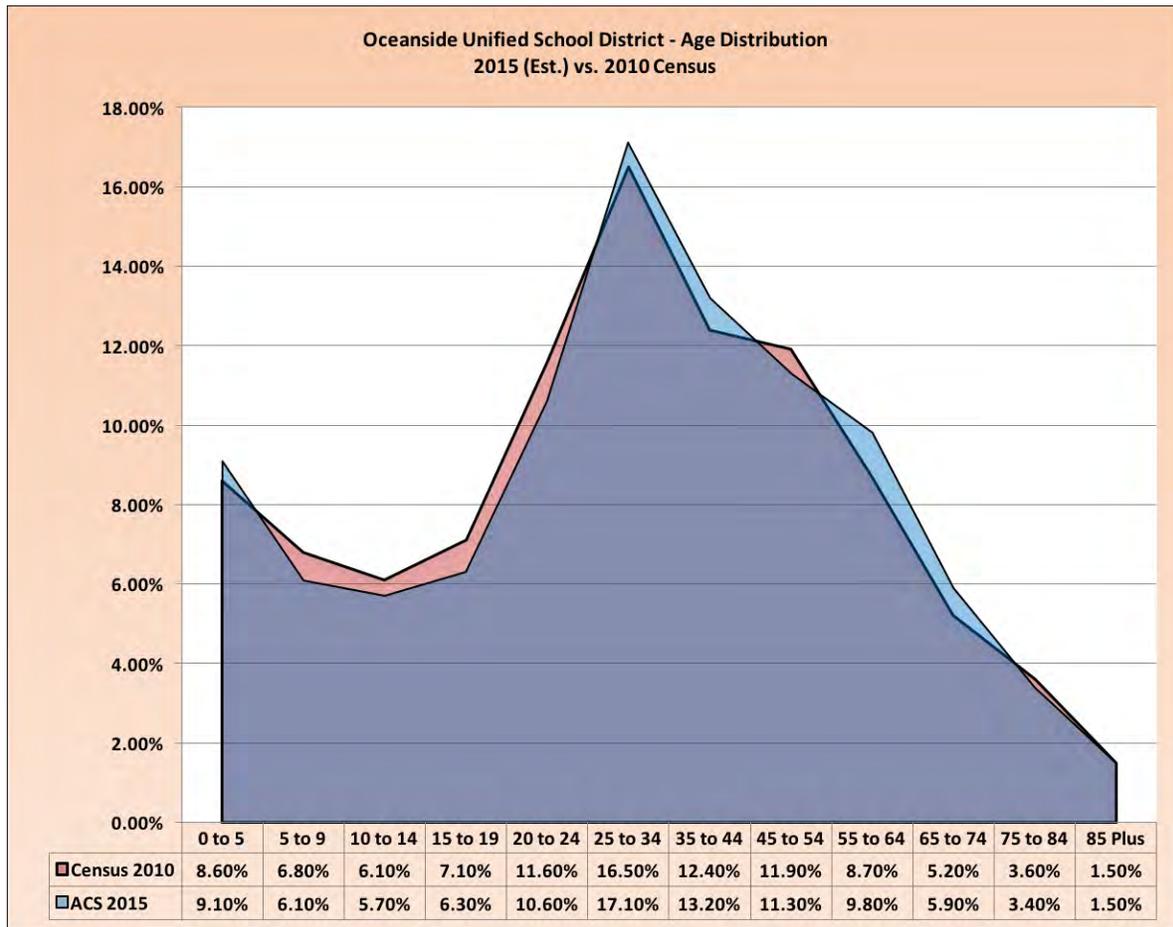

The period from 2010 to 2015 has witnessed a slight aging of the area’s resident population as is depicted in **Figures 1 & 2**. The median age rose from 30.3 years in 2010 to 31.5 years as of 2015 – an increase of 1.2 years. This compares to California’s median age which moved from 35.2 years in 2010 to 36.2 years in 2015. Within the OUSD boundary, the 45-and-up age group increased from 30.9% of the population in 2010 to 32.0% of the population by 2015. The 34-and-under age group decreased from 56.7% of the population in 2010 to 54.9% of the population in 2015. While this aging does not likely contribute positively to the District’s student population, it does provide a capable workforce.

The school age population (5 years to 19 years) in the District’s “sphere of influence” decreased from 28.6% of the population in 2010 to 27.2% in 2015. In 2010, the largest segment of the resident population was the 25- to 44-year age group, which at that time represented 28.9% of the total population. In 2015, this same group remains predominant; but accounts for 30.3% of the population.

Figure 1 Age Distribution

Age Distribution – Oceanside Unified School District Resident Population			
Age Group	ACS 2015 Estimate	Census 2010	Change from 2010
0 to 5	9.1%	8.6%	0.5%
5 to 9	6.1%	6.8%	(0.7%)
10 to 14	5.7%	6.1%	(0.4%)
15 to 19	6.3%	7.1%	(0.8%)
20 to 24	10.6%	11.6%	(1.0%)
25 to 34	17.1%	16.5%	0.6%
35 to 44	13.2%	12.4%	0.8%
45 to 54	11.3%	11.9%	(0.6%)
55 to 64	9.8%	8.7%	1.1%
65 to 74	5.9%	5.2%	0.7%
75 to 84	3.4%	3.6%	(0.2%)
85 Plus	1.6%	1.5%	0.0%
Median Age	31.5	30.3	+1.2
CA Median Age	36.2	35.2	+1.0

Figure 2 Resident Age Distribution, 2015 vs. 2010

Forecast for Region

Population forecasts through the year 2050, as provided by the San Diego Association of Governments (SANDAG) reflect a 12% increase in the population of Oceanside over the next 34 years – or a compounded annual growth rate (CAGR) of 0.3%. This compares to the Countywide forecasts of a 29% increase in population or a CAGR of 0.7%.

Housing Units

The 2010 Census data indicates that there were 50,968 housing units within the OUSD boundaries of which 45,604 (89.5%) were occupied and 5,364 (10.5%) vacant. There is no comparable data available specifically for the OUSD area either in the 2000 Census or in the 2015 American Community Survey. In 2010, the number of individuals per household within the District’s boundaries was approximately 2.85.

Employment

The area's economy is largely based on five major industries: educational, social and health services (17%); professional, engineering, scientific & business services (13%); wholesale & retail trade (13%); arts, entertainment, recreation & accommodation and food services (10%); and manufacturing (10%).

Within the Oceanside City area, it is estimated that in the 16 years and over age group approximately 110,376, 74,725 (67.7%) were in the labor force while 35,651 were not. This data is based on the **2015 American Community Survey 1-Year Estimate**.

Residential Development

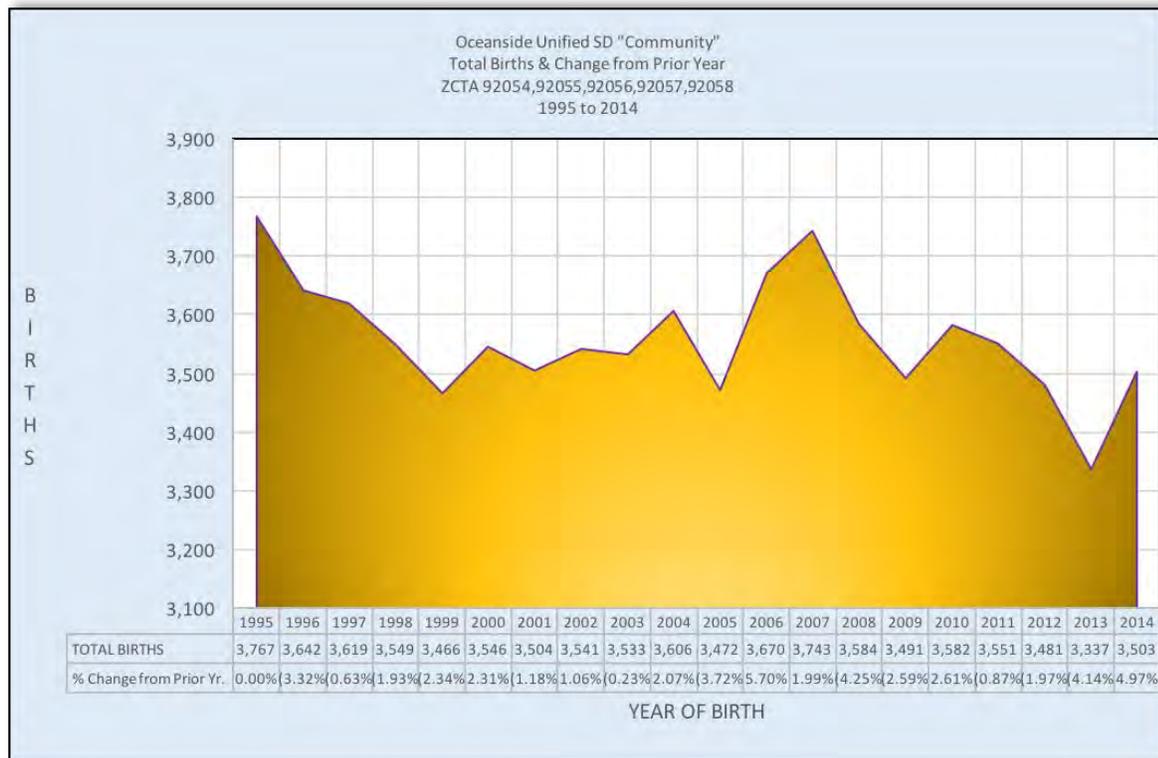

While there was a significant slowdown in development during the recession of the last decade, there is some evidence of a resurgence in the greater Oceanside area. An analysis of the City of Oceanside's Development Services Department's database reveals a number of potential projects moving through the various stages of the approval process. The projections offered in this document with regard to residential development only reflect that development that has been approved by the City of Oceanside's City Council. Throughout this document, EH&A has taken care to ensure that EH&A's assessment as to the number of residential dwelling units to be constructed represents a viable number that would be used in the generation of enrollment projections.

The specific developments under consideration are presented in **Figure 2** and use EH&A's best estimate as to a phasing schedule. Both the construction and phasing schedule will remain fluid and are heavily dependent upon the economic conditions present at the time of construction. As a result, development schedules should be reviewed and revisited annually as part of the District's enrollment projection processes. EH&A's enrollment projections include the occupancy of 1,062 units over the ten-year projection window as reflected in **Figure 4**.

Birth Rates

While there is no specific data maintained for births for the precise District boundary area, there is data available for the 92054, 92055, 92056, 92057 and 92058 ZCT that more than encompass the District's boundaries. The number of births in this region has declined in six of the last ten years represented (**Figure 3**). During this same period, births ranged from a high of 3,743 in 2007 to 3,337 in 2013. The Oceanside Unified School District's percentage of the births from this region that go on to be kindergarteners at OUSD has ranged between 47.2% and 53.0%. The District's kindergarten population has generally decreased over the past four years; and despite changes in legislation regarding entrance into kindergarten, it remains unclear as to the impact that a general decline in births will do to the overall student population. This factor, combined with both the effect of the aging and of the overall population within the region, will continue to make accurate student enrollment projections more difficult.

Figure 3 Total Births, 92054, 92055, 92056, 92057, 92058

Enrollment

State Enrollment Projections

According to the Demographic Research Unit of the California State Department of Finance, K-12 enrollment in California will grow by 1.4 percent to reach 6,294,131 students by 2021-22. While this growth will result in an overall increase of more than 87,000 students in this period, it represents a decline from prior projection series.

Kindergarten enrollment is expected to continue to increase due to changes to the kindergarten age of admission (Chapter 705, Statutes of 2010), as some students now qualify for a two-year kindergarten program.

Elementary enrollment is expected to increase by 60,736 students by 2021-22, to total 4,291,150. The 2012 birth projections series developed by the state incorporate a perceived decline in births, contributing to lower elementary enrollment and reduced growth for future total enrollment.

Having said this, it remains unclear what impact changes in statute regarding cut-off dates for entry into kindergarten will have within the District.

Oceanside Unified School District Enrollment History

As of the 2016-17 school year, the District served a population of 18,453 students in 24 schools.

Over the past ten years, the District's enrollment has steadily declined. The enrollment history by grade is shown in **Figure 4**; the enrollment history by school is shown in Ivey; the annual percent change in enrollment by school is shown in **Figure 6**; and a graph of enrollment history is represented in **Figure 7**.

Figure 7 Oceanside Unified SD, Ten-Year Enrollment History

Oceanside Unified School District Enrollment Projections

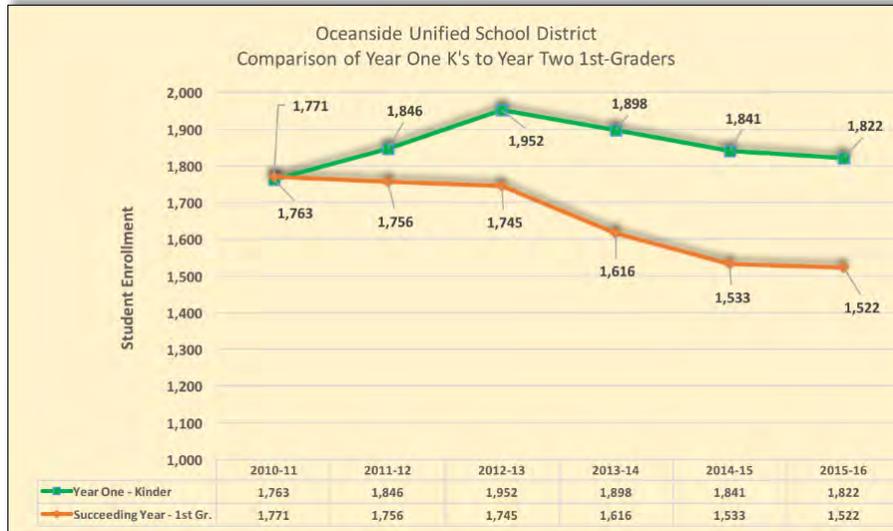

Declining Enrollment

The historical trend of declining enrollment in the District can be attributed to a number of factors including:

- A slight aging of the population as identified by an increase in the median age in the area (**Figure 1**) and a slight shift in the age distribution (**Figure 2**).
- A general decline in the absolute number of births throughout the area. This trend mirrors the trend occurring throughout the greater San Diego County area.
- A closer look at the “grade progression, cohort survival” of OUSD students from year-to-year (e.g. one year’s kindergarteners becoming the next year’s first-graders, first-graders to second-graders, etc.) has revealed an erosion in the “survival” rate in some cases. Of particular note is the survival rate of OUSD kindergarteners that became the next year’s first-graders over the past five years. In the five years commencing with 2011-12 and ending with 2015-16, there were 9,359 kindergarten/TK students. Of those 9,359, the District generated 8,172 first-graders – an apparent loss of 1,187 potential students. While it is unclear as to why this erosion is occurring, whether it be migration to charter schools, timing of military deployments or “out migration” from the region, reasons for this loss of retention should be researched and analyzed to ascertain the causes and to decide whether

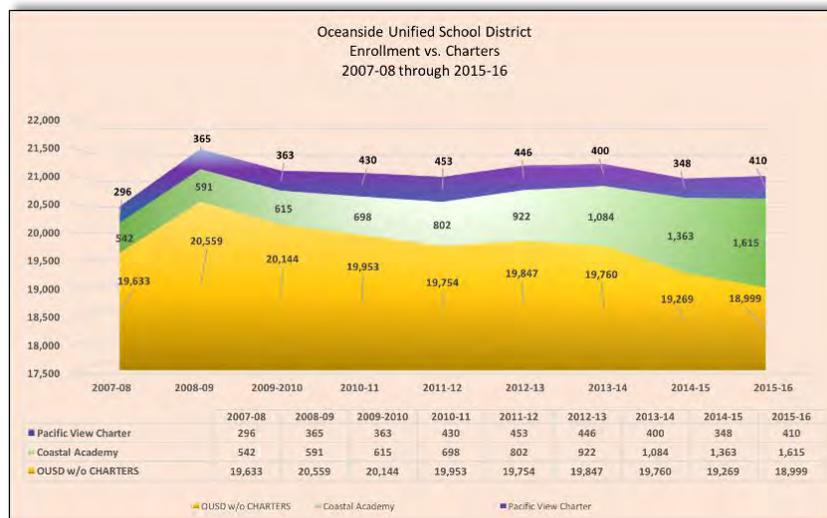

any action is warranted by the District. This trend has been incorporated into the enrollment projections contained in this document and is reflected in **Figure 8**.

Figure 8 First Grade VS. Kindergarten Population -Past Five Years

- A significant growth in the student population at Coastal Academy – growing from 591 students in 2008-09 to 1,615 students in 2015-16. This represents an increase of 1,024 students or 273%. During the same time period, OUSD’s non-charter population decreased from 20,599 to 18,999 – a decline of 1,600 students or 7.8%. When Coastal Academy Charter, Pacific View Charter and OUSD’s population are taken together, as illustrated in **Figure 9** below, the total population of these three entities has remained relatively flat over the past seven years.

➤ **Figure 9 Comparison of OUSD, Coastal Academy & Pacific View Charter Enrollment**

At the present time, EH&A's enrollment projections portray a continuing decline in the student population of the District. This trend could "flatten out" should there be a sustained increase in births; or in the alternative, robust residential development. The area's population growth will remain somewhat contingent upon the development and land use policies promulgated by the various local and regional governing bodies as well as the health of both the local and state economy. Together these factors will make assessing future enrollment trends more difficult.

Housing Development

While there are a number of residential development projects under consideration within the OUSD's boundaries, they are still progressing through the various stages of the approval process prior to being able to commence construction, EH&A has only considered projects that have gone through the entire approval process before considering them in our enrollment projections in the interest of maintaining a conservative approach. The city of Oceanside has approved a number of residential housing projects that are either currently underway or have a documented phasing schedule.

With the assumptions noted above, the District's enrollment is projected to exceed 4,000 by 2026-27. The District should maintain an ongoing dialogue with local developers and revisit and review residential development plans annually to assess the viability, accuracy and timing of construction schedules. This review will inform and clarify future enrollment forecasts and will be instrumental in future facilities planning efforts

These developments are listed in **Figure 10** below on the next page:

Enrollment Projection Methodology

The methodology used to project enrollment for Oceanside Unified School District’s K-12 population is referred to as the “grade progression, cohort survival” method. This process involves mathematically “moving” each student up one year, while at the same time recognizing that 100% of a one grade’s cohort does not automatically ascend to the next higher grade. The “survival” of the cohort from year to year is typically dependent upon a number of factors, including family relocations, inter-district transfers, movements to and from a charter school, etc.

This method does not use “matched” data – that is, it does not follow a particular student; but does recognize that there are historical trends that can be measured and tracked to identify the percentage of students in one particular grade that progress on to the next grade.

Several assumptions were made in the development of the enrollment projections presented in **Figures 11, 12 and 13**. These assumptions include:

- Unofficial CALPADS data for the 2016-17 year was provided by the District; while prior years' information was extracted from the CALPADS system.
- Growth resulting from residential development was determined by calculating the number of new dwelling units by type, including single-family detached (SFD), multi-family attached (MFA) and apartments (APT) and multiplying the number of units to be constructed by a Student Yield Factor (SYF). The SYF for each housing type was based upon previous studies conducted by consultants for the District and are delineated in this document.
- The Student Yield Factors (SYF) for the various housing types currently being constructed are based upon data developed for the District by *Davis Demographics & Planning, Inc.* as part of its 2015 Demographic Study.
- The inclusion of 1,062 new residential dwelling units is expected to generate approximately 148 additional students, which have been incorporated into the ten-year enrollment projections.
- Enrollment growth from development is anticipated to begin with the 2017-2018 year and extend through the 2019-2020 year at selected schools within the District. Other than those projects specifically identified, no other major residential developments have been considered in developing the enrollment projections.
- Birth rates are expected to continue to decline, which will continue to put pressure on student enrollment.
- Within the grade progression, cohort survival projection model, four different mathematical techniques were employed:
 - ✓ One method uses a three-year moving average of student “survival” rates; and
 - ✓ A second method uses a five-year moving average of “survival” rates
 - ✓ Within each of these two techniques, there are two “branches”:
 - ❖ The use of a three and five-year weighted average (i.e., the most recently completed year in either the three or five-year average is weighted more heavily than the preceding year; and so forth); and,
 - ❖ The use of a three and five-year simple average (i.e., all years in both the three and five-year period carry equal “weight”)

District-wide Enrollment Projections for K-12 Students

As indicated previously, four District-wide enrollment projections were calculated – two using a three-year moving average and two using a five-year moving average. Both the three-year and five-year averages are used to reduce the impact of either recent, or more distant events that might skew existing trends or patterns. Within each of the two approaches, both a weighted average and a simple average were calculated.

You will note that the enrollment projections using the “5-year simple average” yield the highest of the four enrollment projections while the projections using the “3-year simple average” yields the lowest. A close inspection of the raw data reveals that cohort “survival” rates between grades using the 5-year simple average are the highest; while conversely the 3-year simple average has the lowest survival rates. This disparity is the result of the mathematical effect of the most recent enrollment drops affecting the three-year averages while having a lesser effect on the five-year averages.

The four District-wide enrollment projections are presented in **Figures 11 & 12**. **Figure 12** illustrates the “baseline” enrollment without the impact of growth; while Figure 11 includes the impact of enrollment growth – the result of residential development. Because the impact of residential development only yields an increase of 148 students by the end of the projection period, the differences in these two charts is minimal.

Because of the methodologies used in developing school-by-school projections versus those employed in developing District-level projections, the sum of the enrollment projections by school will not reconcile precisely with the District-wide projection for any given year. Notwithstanding the above, the school-level projections are intended to be useable in the development of the District’s Long-Range Facilities Master Plan.

NOTE: **OTHER** includes ATP

Demographic Summary

- An increase in the median age in the District's region from 2010 to 2015 has as well as a decrease in births will continue to negatively impact the number of kindergarteners available to the District.
- While there appears to be the beginnings of a resurgence in residential development throughout the area, the number of approved projects will have a minimal impact on future enrollment. Should there be an acceleration in the approval of residential development in the area, the impact on OUSD's population would be positively impacted. The District should maintain an ongoing dialogue with local developers and revisit and review residential development plans annually to assess the viability, accuracy and timing of construction schedules. This review will inform and clarify future enrollment forecasts and will be instrumental in future facilities planning efforts.
- The extent of residential development and future development will be in great part governed by land use policies promulgated by local legislative bodies.
- A significant shift in enrollment patterns and survival rates over the past five years has resulted in a disparity between the three-year and five-year cohort survival rates at OUSD as reflected in the enrollment projections. This trend is particularly evident between kindergarten and first grade. While it is unclear as to the reasons for this erosion, this issue should be researched and analyzed to determine the causes and to decide whether any action is warranted by the District. This trend has been incorporated into the enrollment projections contained in this document.
- In **Figures 9 & 10** you will note a wide range of enrollment projections, particularly between the "five-year simple" average and the "three-year simple" average. This divergence is the result of the mathematical effect of recent enrollment drops that affected the three-year averages while having a lesser effect on the five-year averages. At this time, it remains difficult to determine whether the three-year data will continue to be a trend or will be viewed, in retrospect, as a short-term aberration and anomaly.
- The enrollment projections could also be affected by any number of unanticipated changes, including both local and state economies as well as further demographic changes within the District.
- Based on current trends and patterns, the District will continue to experience a decline in enrollment through the projection period absent additional, significant increases in residential development.

Classroom Capacity Analysis

The objective of the school capacity study and analysis portion of this Study is to assess the Oceanside Unified School District’s current “inventory” of instructional spaces as well as the use of those spaces; and to serve as a tool to guide the District in facility planning, student transfer policies, and program expansion. The study can also help form the basis for the calculation of state eligibility for funding of school facility construction and modernization projects.

The capacity analysis can also be the foundation for both board policies and administrative regulations that assist the board of trustees, superintendent, and staff in exploring solutions to provide a high-quality learning environment for students. These policies and regulations can also help define the optimal enrollment capacities at each school site. Factors such as programs offered, academic standards, school safety, as well as the size and configuration of libraries, administrative facilities, restroom, physical education, and other support facilities should be taken into consideration in establishing school site capacities.

In developing this capacity analysis, each classroom at each campus was specifically identified and “loaded” utilizing three different standards including:

- the State Allocation Board (SAB) loading standards;
- the current classroom loading standards as outlined in the District’s collective bargaining agreement; and,
- the District’s “Goal” for loading classrooms

EH&A worked closely with District staff in identifying District standards within grade spans and distinguishing the loading factors for both regular and special education students. A comparison of the three loading standards is presented in the chart below:

	Classroom Loading Standards		
	State (SAB)	District – Current	District – Goal
Grades 4-5 Regular	27	36	29
Grades 6-8 Regular	27	30	29
Grades 9-12 Regular	27	37	29
K-3 CSR	25	24	24
Spec. Ed/Non-Severe	13	13	13
Spec. Ed/Severe	9	9	9

NOTE: Learning spaces that are larger than 700 square feet in size were counted as classrooms

As is evident, the District uses different loading standards for various grade levels as a practical matter in addressing both its facility needs as well as the contractual obligations it has with its staff.

The SAB classroom loading standard is and will be used in calculations to determine the District's eligibility for State School Facility Program (SFP) funding.

The capacity analysis counted all spaces that met the three criteria pursuant to the California Department of Education's (CDE) "Classroom Definition Policy" (March 19, 2009): 1) larger than 700 square feet in size; 2) built as a classroom; and, 3) used as a teaching station for the last 5 years (**Figure 14**). A summary of both the State and District classroom counts are depicted in **Figure 15**; and a comparison of the three capacity standards compared to the most current enrollment data is illustrated in **Figure 15**. Comparative information regarding both classroom counts as well as a "Capacity vs. Enrollment" charts are included in **Exhibit B**.

Figure 14 Criteria for Calculation of Classroom Inventory for State and District Capacity

	State Capacity Standard	District Capacity Standard
Classrooms >700 sq. ft.	Yes	Yes
<u>Add</u> Instructional Spaces that are:		
Shops	Yes	No
Science Labs	Yes	No
Computer Labs	Yes	No
Computer Classrooms	Yes	No
Closed School Classrooms	Yes	No
Used for Community Day School	Yes	No
SDC or Resource Spec.	Yes	Yes
<u>Exclude</u> spaces used for:		
Child Care/Pre-School	Yes	Yes
Adult Education	Yes	Yes
Classrooms leased to another District	Yes	Yes
Classrooms < 700 sq. ft.	Yes	Yes
Portables > 25% of total permanent Classrooms	Yes	No

Equals Total Inventory

Because of the differences highlighted in the table above, many of the charts and tables identify a variance in the capacity calculations when using the state standards versus using the District standards. The above table illustrates the differences in the criteria used in the various capacity calculations.

To meet the needs of the future enrollment in the District, EH&A recommends the District conduct an annual review of this capacity analysis, and the administrative regulation addressing enrollment and capacity. As population shifts occur within the District or a need for boundary changes occur, this analysis can prove to be quite useful in assessing facility impacts to all stakeholders.

In addition, changes to special programs as well as changes in student enrollment can be better evaluated after using the capacity study to assess and evaluate classroom configurations and utilization.

Classroom Capacity – State Eligibility Standards

District classroom capacity has been calculated using a number of different loading standards. These include using the state standard as well as District standards. The state standards for existing school district building capacity and classroom loading are outlined in Education Code Section 17071.10-17071.46 and State Allocation Board (SAB) regulations Sections 1859.30 through 1859.35. This capacity data forms the basis for determining a district's eligibility to obtain funding from the various state School Facility Programs (SFPs), including modernization and new construction projects.

Capacity under state eligibility standards is calculated by calculating Gross Classroom Inventory and then reducing this count for specific classrooms as defined in code, including preschool classrooms; adult education centers; classrooms owned but leased to another district; and by the number of portables in excess of 25% of the total permanent classrooms.

Those remaining available classrooms are loaded at state loading standards and identified as follows:

- K-6 classrooms at 25 students per classroom
- Grades 7 – 12 classrooms loaded at 27 students per room
- Special Education/Severe classrooms at 9 students per room
- Special Education/non-severe classrooms at 13 students per room

Using the state's eligibility standards, the District has 747 permanent and 242 portable classrooms for a total of 989 classrooms. The capacity of these classrooms has been calculated as 23,852 students.

Classroom Capacity Calculations

The calculation of classroom capacity combines two factors – the inventory count of classrooms combined with the classroom loading standards.

Classroom Loading – District Standards

The student capacity using District standards is obtained by considering only instructional classrooms and loading them at the District standard classroom load as identified by either board policy, collective bargaining agreement (CBA) or past practices. Instructional classrooms for District counting purposes share the same definition as classrooms counted in the state calculations. In addition, the District has identified a “goal” loading standard for each of its grade spans which is depicted below:

Figure 15 District Classroom Loading Standards - Current and Goal

	District Classroom Loading Standards	
	District – Current	District – Goal
Grades 4-5 Regular	36	29
Grades 6-8 Regular	30	29
Grades 9-12 Regular	37	29
K-3 CSR	24	24
Spec. Ed./Non-Severe	13	13
Spec. Ed/Severe	9	9

Classroom Inventory Comparison

Because of the differences in the method of calculating the number of classrooms between the State and the District, the exact count of classrooms can vary. Using the District's program standards, there are 806 classrooms of which 187 are portable classrooms. These portables account for 23% of the total number of classrooms District-wide. However, the percent of portables vary by grade spans with 33% of the elementary classrooms being portable; 19% of the middle school classrooms; and 9% of the high school classrooms being portable. The weighted average District-wide equates to 23%.

Because of the criteria for determining what constitutes a classroom by the State versus what the District counts as a classroom, State's count of OUSD classrooms is 989 total of which 242 classrooms, or 24% are represented by portables. The comparison is illustrated in **Figure 14** is comparison reveals that based on estimated current enrollment; the District has excess capacity of 3,917 District-wide.

Facilities Assessment & Project Prioritization Process

Background

The scope of services for the LRFMP includes a facility needs assessment to help identify priority projects at District school sites. EH&A worked closely with the Superintendent, Deputy Superintendent, Assistant Superintendent of Business Services, Director of Facilities and District leadership to conduct workshops, review documents, and interview District staff. Through this interactive assessment effort projects were identified and ranked.

Process

EH&A met with Assistant Superintendent of Business Services, Chris Wright and Director of Facilities, Matt Evans between June and December 2016. The goals and scope of the LRFMP were discussed and identified. The condition of existing facilities and need for facility improvements were generally discussed.

EH&A met with District staff to begin assessing District facilities. The process of facility evaluation included meeting with stakeholders to ensure that the broader community's concerns were heard and considered as well as developing a process to prioritize which projects would be of most benefit to each campus and to the District.

Campus Input, Facility Committee

EH&A reviewed many documents, including:

- ✚ Classroom Capacity Analysis
- ✚ Educational Specifications
- ✚ Site Profile Worksheets
- ✚ Summary of Proposed Projects to be finished under Prop G, June 18, 2007
- ✚ OUSD Teaching Station Summary, February 18, 2008
- ✚ New Construction Eligibility documents, May 5, 2014
- ✚ OUSD Summary of Actual and Estimated Modernization Funding, March 24, 2014
- ✚ Inventory of OUSD Relocatable Buildings, October 5, 2016
- ✚ Other information provided by the District

EH&A contacted the Deputy Superintendent, Reginald Thompkins, Assistant Superintendent of Business Services, Chris Wright and Director of Facilities, Matt Evans to obtain detailed information concerning the District's needs for educational infrastructure and informational technology improvements.

Based on EH&A's review of documents and interviews EH&A prepared Site Profile Sheets (**Exhibit C**). The sheets were generated for all District support and campus wide projects.

Projects were prioritized and organized into the following categories:

-  Health & Safety
-  Classroom Modernization
-  Support Facilities
-  Athletic Facilities
-  Playing Fields
-  Site Modernization
-  Technology
-  New Construction

On November 14, 2016, EH&A conducted a meeting with the Superintendent's Facility Advisory Committee consisting of District administrators, site principals, teachers, classified staff, parents and students. The purpose of the committee meeting was to explain master plan process, importance of obtaining input from site leadership and to establish the parameters for collecting information about each site's facility conditions, needs and concerns.

EH&A revised the Site Profile Sheets based on the November 14th, 29th and 30th, 2016 meetings. These revised sheets were distributed to site leadership. The leaders were then asked by Assistant Superintendent, Chris Wright to reach out to school site stakeholders, including certificated and classified staff, and parent leaders to obtain additional input on the recommended priority needs of each campus. Information obtained by the campus leaders was then provided to EH&A, and the Site Profile Sheets were updated accordingly.

Prioritization Process

On December 6, 2016, EH&A met with the Superintendent's Facility Advisory Committee to engage in an exercise to develop recommendations on the prioritization of facility improvements. This "dot" exercise involved listing all major projects on poster paper by school site.

The committee was provided color-coded dots. Participants were given dots to identify the projects they believed should receive the highest priority ranking for their site. After placing the dots, a representative from each campus advocated why certain projects at their sites were important and should be given priority consideration. Participants received additional dots, to be used on another campus' to rank projects on sites other than their own. The total point values assigned by the group through the "dot" exercise was later tallied and included in the Site Profile Sheets. A matrix displaying the result of this meeting and the results of this facility needs assessment by highest priority project and points assigned is included in the plan as **Exhibit C**. The total point values assigned by the group through the "dot exercise" were later tallied by EH&A and included in the report as **Exhibit E**. The Capital Facilities Funding Plan provides resources that include future bond authorization for funding and can be found in **Exhibit F**. **Exhibit G**, The Architect's Cost Estimate, provides analysis of priority projects and estimates the cost by applying a schedule for construction, including hard and soft costs. It also includes costs for project inflation.

Funding Alternatives

The information in this section identifies a variety of funding mechanisms that may be available to the District as resources to fund improvements to existing facilities and/or construction of new facilities within the District.

School District Participation in the State's School Facility Program

The recently approved Kindergarten through Community College Public Education Facilities Bond Act of 2016 (Proposition 51) authorizes \$7 billion in state general obligation bonds for K-12 schools. The state had not passed a bond since 2006 and these funds are critically needed.

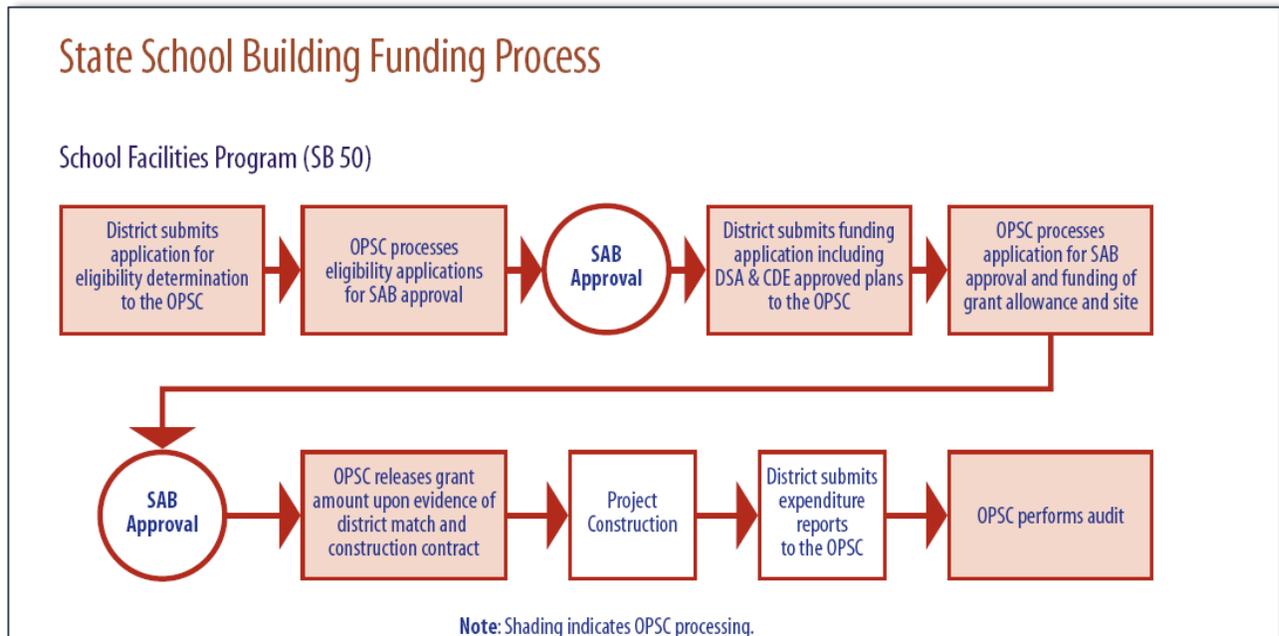

This measure preserves current Leroy F. Greene School Facilities Program major elements. This measure will provide matching funds to K-12 school districts and charter schools for new construction, modernization, hardships and emergencies. The measure provides \$3 billion for new construction; \$3 billion for modernization; \$500 million for Career Technical Education (CTE); \$500 million for Charter Schools.

The SFP is a per pupil grant program providing funding for new construction on a 50/50 state/local basis and for modernization on a 60/40 state/local basis. The District can participate in both the 50/50 new construction and 60/40 modernization programs after establishing baseline eligibility.

Baseline eligibility for new construction is the number of un-housed students projected at the end of five years. Eligibility is established by completing SAB forms Enrollment Certification/Projection SAB 50-01, Existing Building Capacity SAB 50-02, and Eligibility Determination SAB 50-03 (**Figure 18**). The eligibility is determined by subtracting the number of students housed in existing classrooms from the five-year projected enrollment.

The calculation of students housed uses the state loading standard of 25 students/classrooms for grades K–6. The five-year projected enrollment uses a grade progression cohort survival methodology. It must be noted that an application for funding requires that the District receive prior approval of plans and specifications from the CDE and the Division of the State Architect (DSA).

Figure 18 State School Building Funding Process

District Participation in the State School Facility Program

The District has historically been successful in pursuing state funding. Between 1999 and 2012, the District received \$108,956,881 in SFP funding for new construction and modernization projects.

Based on data from EH&A research, records with the Office of Public School Construction (OPSC) indicate the District has potential eligibility for up to approximately \$31,586,889 in matching state funds; \$24,238,879 in potential modernization funding and \$5,879,130 in potential new construction funding. An evaluation of local District and state records may determine additional eligibility for new construction and modernization funding.

Proposition 39 (California Clean Energy Jobs Act)

Proposition 39 was overwhelmingly approved by California voters to provide funding for energy efficiency projects in schools, expand clean energy generation, and create clean energy jobs in California. Proposition 39 was anticipated to transfer an estimated \$550 million in new revenue over five years to fund projects for K-12 public schools, charter schools, county offices of education, and community colleges.

The California Energy Commission (CEC) adopted final program guidelines on December 19, 2013. Handbooks, forms, calculators, and additional guidance were released on January 31, 2014. The guidelines were designed to help achieve the outcomes specified in the act and included instructions for submitting energy project expenditure plans to the CEC for approval. Guidelines also included details on how the CDE would release funds. EH&A followed the developments and participated in discussions at the local and state level for this program.

[Proposition 39 Allocations](#) remain available on the CDE website. Every year CDE evaluated the revenue generated by a tax imposed on corporations that had left California but continued to do business in the state. That revenue (corporate tax) remains the source for Prop 39 funding. The various years' allocations to OUSD are reflected in the graphic below; and while the 2017-18 allocation has not yet been apportioned nor allocated, EH&A is projecting that for planning purposes the 2017-18 revenue allocation will be the same as the 2016-17 of \$1,096,812.

Should the 2017-18 allocation be equal to the 2016-17 allocation, the District will have received approximately \$4,667,147 over the five-year period in Prop. 39 Clean Energy funding. Having said that, the District should recognize that given the state's reduction in awards to school districts in prior years, the 2017-18 allocation may end up being less than is currently anticipated. (Figure 19).

Figure 19 Award Allocation for Prop 39

Local Educational Agency	Energy Expenditure Plan (EEP) Amount Approved**	2013-14	2014-15	2015-16	2016-17	Totals					
		Award Allocation	Award Allocation	Award Allocation	Award Allocation	Total Award Allocation	Planning Funds Paid	EEP Funds Paid	Funds Returned	Award Allocation Remaining	EEP Funds Remaining ***
Oceanside Unified	\$1,003,895	\$926,644	\$808,087	\$736,792	\$1,096,812	\$3,570,335	\$278,593	\$1,003,895	\$0	\$2,287,847	\$0

Greening Programs

There are programs available to help school districts conserve energy. [DSA's Sustainable Schools Resource](#) site provides a list of resources to help schools build energy-efficient facilities. The CEC Bright Schools program provides technical assistance to California K-12 schools to identify energy-saving opportunities. The program provides consulting, planning, and design services for modernization and new construction. Districts that need funding for projects can apply for low-interest loans through the CEC.

The **CEC Go Solar California** program provides rebates on solar energy installations. **Savings by Design** (SBD) is an energy efficiency program for California non-residential new construction. The SBD program is funded by utilities, and provides design assistance and financial incentives.

In addition, the OPSC High Performance Incentive Grant (HPI) program provides funding for eligible projects with high performance attributes.

Deferred Maintenance, Fund 14

This fund is used to account separately for state apportionments and the LEA's contributions for deferred maintenance purposes. Moneys in this fund may be expended only for the following purposes:

- a. Major repair or replacement of plumbing, heating, air-conditioning, electrical, roofing, and floor systems
- b. Exterior and interior painting of school buildings, including a facility that a county office of education is authorized to use pursuant to Education Code sections 17280–17317
- c. The inspection, sampling, and analysis of building materials
- d. The encapsulation or removal of materials containing asbestos
- e. The inspection, identification, sampling, and analysis of building materials to determine the presence of materials containing lead
- f. Any other maintenance items approved by the State Allocation Board

In addition, whenever the state funds are insufficient to fully match the local funds deposited in this fund, the governing board of a school district may transfer the excess local funds deposited in this fund to any other expenditure classifications in other funds of the District. The ending balance for this fund as of June 30, 2016, was \$0.00.

It must be noted that with the advent of the Local Control Funding Formula (LCFF), the state no longer provides apportionments for this program. Notwithstanding that, it is critical for the District to continue to assess and consider the ongoing cost of deferred maintenance in planning its annual budget as part of its fulfillment of the District's Local Control Accountability Plan (LCAP) as well as to fulfill its commitment to the District's residents that bond-financed facilities will continue to be well maintained.

Building Fund, Fund 21

This fund exists primarily to account separately for proceeds from the sale of bonds and may not be used for any purposes other than those for which the bonds were issued. Other authorized revenues to the fund are proceeds from the sale or lease-with-option-to-purchase of real property and revenue from rentals and leases of real property specifically authorized for deposit into the fund by the governing board.

The principal revenues and other sources in this fund include:

- ✚ Rentals and Leases
- ✚ Interest
- ✚ Proceeds from the Sale of Bonds Proceeds from the Sale/Lease–Purchase of Land and Buildings

Expenditures in Fund 21 are most commonly made against the 6000 object codes (Capital Outlay). Another example of an authorized expenditure in Fund 21 is repayment of State School Building Aid out of proceeds from the sale of bonds. As of June 30, 2016, the balance in this fund was \$20,459,640.

Capital Facilities Fund, Fund 25

This fund is used primarily to account separately for moneys received from fees levied on developers or other agencies as a condition of approving a development. Interest earned in this fund is restricted to that fund.

The principal revenues in this fund are the following:

- ✚ Interest
- ✚ Mitigation/Developer Fees

Expenditures in Fund 25 are restricted to the purposes specified in Government Code sections 65970–65981 or to the items specified in agreements with the developer (Government Code Section 66006). Money in this fund can be used to pay for the expansion of existing school facilities and the construction of new school facilities necessary to adequately house students generated from new residential development. Expenditures incurred in another fund may be reimbursed back to that fund by means of an interfund transfer. As of June 30, 2016 the balance in this fund was \$3,980,508.

County School Facilities Fund, Fund 35

This fund is established to receive apportionments from the SFP authorized by the SAB for new school facility construction, modernization projects, and facility hardship grants, as provided in the Leroy F. Greene School Facilities Act of 1998.

The principal revenues and other sources in this fund are:

- ✚ School Facilities Apportionments
- ✚ Interest
- ✚ Interfund Transfers In

Funding provided by the SAB for reconstruction of facilities after disasters such as flooding may be deposited to Fund 35. Typical expenditures in this fund are payments for the costs of sites, site improvements, buildings, building improvements, and furniture and fixtures capitalized as a part of the construction project. The District currently does not utilize this fund.

Special Reserve Fund for Capital Outlay Projects, Fund 40

This fund exists primarily to provide for the accumulation of general fund monies for capital outlay purposes and may be used to account for any other revenues specifically for capital projects that are not restricted to funds 21, 25, 30, 35, or 49. Other authorized resources that may be transferred to funds are proceeds from the sale or lease-with-option-to-purchase of real property and rentals and leases of real property specifically authorized for deposit to the fund by the governing board. The District does not currently utilize this fund. **Figure 19** summarizes the balances and projected balances in the funds listed above.

Figure 20 Summary of Funding Resources, Fund Balances as of June 30, 2016

Fund Description	2014-15
Deferred Maintenance – Fund 14	\$0
Building Fund – Fund 21	\$20,459,640
Capital Facilities – Fund 25	\$3,980,508
Prop 39 – 2017-18 Award Allocation	\$1,096,812
GRAND TOTAL	\$25,536,960

Local General Obligation Bond

A school district can propose a local tax ballot measure to generate funds to build new schools, add to existing facilities, or modernize existing facilities. There are two types of general obligation bonds.

A school district can seek to generate local funds for school facility construction through a super majority (⅔ vote) affirmative vote.

Proposition 39, passed by California voters on November 7, 2000, enabled a school district to pass a bond with only a 55% approval rating. In exchange for a lower threshold for passage, Prop 39 includes accountability requirements, such as audits, specific regulations such as maximum tax rates (the maximum tax rate for elementary school districts is \$30/\$100,000 and high school or unified school districts is \$60/\$100,000 assessed value per parcel), a specific list of projects to be funded in the ballot language, and taxpayer oversight. The school district is responsible for establishing a citizen’s oversight committee (COC) made up of not less than seven community members.

The memberships should include a parent of a student in the school district, a member of a parent/teacher/student organization such as the PTA, a representative of the local business community, a senior citizen, and a member of a bona fide taxpayer organization. Members of this committee do not have board authority to approve projects or contracts. Their role is to review projects to assure the voting community that the projects the voters authorized are the projects that

were completed. The COC also provides assurance to the public that no administrative salaries or other operating expenditures are charged against the bond proceeds.

Mello Roos Community Facilities Act

A Community Facilities District (CFD), also known as a Mello Roos district, raises money through voter approved special taxes assessed on property owners in the CFD. The tax must be approved by at least 2/3 of voters. The bonds are issued in “lump sum” amounts. Residents in the CFD boundary make annual special tax payments to pay the principal and interest on the bonds. A school district’s general fund is not required to finance any funding shortfall on bond debt service payments.

While general obligation bonds can only fund real property, Mello Roos bonds can also be used for the purchase or improvement to any non-real property (property with a useful life of five years or longer), or to provide services such as maintenance and library services.

Certificates of Participation

Issuance of Certificates of Participation (COP’s) can be used to fund virtually all facilities related needs. This financing option provides relatively unrestricted expenditure of proceeds on facilities and does not require a voter election. Debt service payments for this type of financing mechanism must be secured through a school district’s general fund.

This mechanism is essentially a loan. Because school districts are tax-exempt, this method has advantages over regular private loans. The COP will have a payment schedule with annual or semi-annual payments. The District does have an outstanding 1998 COPs issuance that it is in the process of paying off.

Parcel Tax

Parcel taxes are assessed on the characteristics of a parcel, and passage requires a 2/3rd majority vote of the property owners in the school district boundary. The funds can be used for a wide variety of purposes. Parcel taxes are frequently used for new developments that want premier school facilities in place when the new homes go to market. The developer owns all the parcels initially, the vote is conducted after negotiation with the District on what will be included in the tax, and the facilities that will result are completed. These negotiations typically include timing of the facilities. The requirement to pay the ongoing taxes is then passed to the buyer of each parcel within the development.

School Facilities Improvement District

This approach to funding school facility improvements is very similar to general obligation bond elections. However, through this approach a district may choose to remove properties from the taxation district or to conduct separate elections in multiple taxation districts. School Facilities Improvement District (SFID) elections are similar to the two-thirds majority bond election except that the area of the election does not include some portions of a district.

SFID's are used when a district has CFDs that are paying significant developer fees for the schools in their area while other areas do not have CFD funds and need a bond. This mechanism is typically used in communities where senior citizens who do not support school bonds are in the majority. Communities excluded from SFIDs are not taxed and do not vote.

Redevelopment Tax Increment

In January of 2011, the Governor of the State of California proposed statewide elimination of redevelopment agencies (RDAs) beginning with the fiscal year (FY) 2011-12 State budget. The Governor's proposal was incorporated into Assembly Bill 26 (ABX1 26, Chapter 5, Statutes of 2011, First Extraordinary Session), which was passed by the Legislature, and signed into law by the Governor on June 28, 2011.

ABX1 26 prohibited RDAs from engaging in new business, established mechanisms, and timelines for dissolution of the RDAs, and created RDA Successor Agencies to oversee dissolution of the RDAs and redistribution of RDA assets.

A California Supreme Court decision on December 28, 2011 (California Redevelopment Association et al. v. Matosantos) upheld ABX1 26 and the Legislature's constitutional authority to dissolve the RDAs. ABX1 26 was codified in the Health and Safety Code (H&S Code) beginning with section 34161.

In accordance with the requirements of H&S Code section 34167.5, the State Controller is required to review the activities of RDAs, "to determine whether an asset transfer has occurred after January 1, 2011, between the city or county, or city and county that created a redevelopment agency, or any other public agency, and the redevelopment agency," and the date on which the RDA ceases to operate, or January 31, 2012, whichever is earlier.

Redevelopment funds may be used to fund enhancements to and expansions of existing school facilities and to construct new facilities for students generated by development within a redevelopment project area. This type of funding creates a revenue stream that can be used directly to pay for facilities or "leverage" through the issuance of COPs. The revenue is produced by tax increment via a "pass-through" agreement with the local redevelopment agency for a given redevelopment project area.

Because the District is fortunate to have entered into a redevelopment agreement with the City of Oceanside's RDA pre-1984, the District is currently "grandfathered" into continuing to receive redevelopment "tax increment" despite the ruling that resulted in H & S Code section 34161 et al. In fiscal year 13-14, the District transferred over \$3.3 Million of redevelopment funds to the General Fund to serve two essential purposes – providing funds for the debt service payments associated with the 2010 Refunding Bonds; and providing direct financial assistance to defray general fund expenditures. This is anticipated to continue into the 2014-15 fiscal year. There may be some question as to the likely longevity of this funding based on recent proclamations by the state's Department of Finance (DOF), which may be resolved in the next 24-36 months.

Qualified Zone Academy Bonds (QZAB)

These types of funds are eligible to finance improvements in and equipment for existing facilities. This financing option includes an interest-free loan and requires a minimum contribution of 10% of the project costs from private businesses or business partners. Payments on the loan are secured by a district's general fund. QZABs require an allocation from the State and cannot be issued unilaterally.

Educational Specifications

Educational Specifications for Oceanside Unified SD

Written collaboratively by the Educational Specifications Committee in January 2017. Members of the Ed Specs Committee were Matt Evans, Josh Thibodeaux, David Fogliatti, Tiffany Cooper-Ortega, Doug Kriedeman, Erik Mateljan and Deputy Superintendent Reggie Thompkins. Dr. Jeffrey Felix from Eric Hall & Associates moderated the discussions.

Form follows function. To build school facilities that meet the needs of students and educators, designers must understand the needs of their clients. With dynamic shifts altering the K-12 instructional landscape, designing schools that look just like those we built in the past will not meet the needs of our present and future students. Many of the educational trends and facility objectives identified in this document are not unique to Oceanside, but the issues described herein are of particular interest here.

This document is intended to paint the broad brush strokes of the district's intent for its facilities. Architects and engineers will need much more specific guidance from the District to make key decisions about building design and to produce plans and specifications. Those details will be encompassed in the District's Design Guidelines, which are updated more frequently than this document.

Educational Trends

The history of education is replete with examples of educational trends that have waxed and waned over the years. During the open schools movement of the seventies, the District built two schools on that model that were almost immediately modified substantially to mitigate their deficiencies. Both have subsequently been demolished. The challenge when evaluating educational trends is to distinguish the idea du jour from a lasting shift in direction.

The trends identified here have been observable for several years and are based on broad societal trends that are more likely to progress than to diminish. There are other identifiable trends in education both broadly as well as in the District, but they are unlikely to have an appreciable impact on school facilities.

- **Personalization**

There is a persistent trend towards tailoring both educational programs and learning experiences to suit each individual student, and for students to have voice and choice in determining both what they learn and how they learn it. Personalized learning is distinct from individualized learning, in which students share the same learning goals but progress through the curriculum at their own pace. And differentiated instruction, in which students also share learning goals but receive instruction that is tailored to their learning needs, is a similar but distinct concept. Personalized learning is an instructional approach that encompasses both differentiation and individualization, but is also flexible in content or theme to match the specific interests and prior experiences of learners. It leverages all the different things people have in their individualized inventory that adds value to their learning experience while still considering their prior motivation or unique interest.

This model includes a strong emphasis on parental involvement, more one-on-one teacher and student interaction, attention to differences in learning styles, student-driven participation in developing the learning process, technology access, varied learning environments, teacher and parent development programs, and choices in curriculum programs.

Technology is just one factor that can enhance personalized learning, but many educators feel technology is the essence of the opportunity to provide a much more personalized learning

environment for students. Students have access to traditional learning resources like books and hands-on materials, and time-honored support from people like teachers, parents, mentors, coaches, and schoolmates. But, critically, they have ubiquitous access to technology, which allows them to connect to learning communities, information management and communication tools, personal learning networks, information and data, expertise and authoritative sources, online tutoring and guided sources tailored to their needs, knowledge-building tools, and peers with common interests.

In the classroom, this will be manifested with reduced emphasis on direct, whole-class instruction and a corresponding increase in individual and small group collaborative work. In a campus context, personalization may take the form of multiple pathways across grade levels and with increasing specificity at higher grades.

- **Collaboration**

Personalized learning is a highly social experience. Collaboration plays a large role in the personalized learning model. When students collaborate on a team, they learn to assess their own strengths, and learn from their peers in areas where they have weaknesses.

Classrooms that are conducive to collaborative learning feature furniture that is mobile and easy to create small groups, such as wheeled furniture, bean bag chairs, yoga balls, or tall tables intended for standing. These “active classrooms” are relaxed environments replacing the standard, formalized setting. Active classrooms may use technology in ways conducive to student participation and discussion, and many are simply arranged so that desks are set up to allow students to sit and work in small groups.

Technology that supports small group interaction and extends virtual collaboration tools into the physical world is key to fostering collaborative classrooms. Mid-sized displays suitable for viewing by 3-8 students enable idea-sharing using on-screen collaborative tools. Writeable walls or even windows can serve as small group collaboration venues as well.

We are increasingly asking students to collaborate in groups of various sizes. Students learn valuable interaction skills, practice their communication skills, and learn from each other. School facilities designed to enable student collaboration can empower teachers to create collaborative learning experiences.

- **Authenticity**

An increased emphasis on preparing students for college and careers is beginning to have a profound effect on K-12 education. Educators are discovering that creating learning experiences that require real-world application of knowledge and skills can eliminate students’ age-old question of “Why do we need to know this?”

One manifestation of this trend is an effort to make the school workplace more closely reflect the career workplace, with both individual and collaboration workspaces and tools. In schools this is typically applied in the context of generalized workspaces like desks, meeting areas, or labs. Learning spaces that mimic workplaces help students make the mental leap from their current learning to its practical application in a future career and acclimate them to professional work environments.

Another expression of the authentic learning trend is a renewed interest in Project-Based Learning (PBL). Whatever we call them, PBL and its cousins, Problem-Based, Challenge-Based, and Inquiry-Based Learning share a common thread of acquiring knowledge and skills within the context of practical application. PBL works hand in glove with the current STEM or STEAM movement but is viable in all curricular areas. Learning experiences that require application of knowledge and skills motivate students, deepen their understanding, and develop problem-solving and critical thinking

skills.

Two general types of learning space needs emerge from this trend:

- “Soft” spaces with carpeted floors and sound-absorbent finishes typical of office settings.
- “Hard” spaces better suited to messy activities typical of industrial settings. Traditionally these have been limited to science labs and wood or auto shops, but “makerspaces” belong here as well. These spaces require storage space suitable for materials and student projects.

- **Mobile Technology**

Handheld technology is fundamentally changing the way people access factual information. While this trend will inevitably alter every aspect of human endeavor, technology adoption in K-12 classrooms is currently in transition as schools struggle to find resources to acquire and support technology and the concomitant migration to digital content and systems. Nevertheless, today’s students face a future in which they and everyone around them will have a supercomputer with an artificial intelligence assistant in their pocket. With access to information universal, the ability to find, evaluate and apply information will become increasingly valuable.

Mobile technology in schools presents a number of significant facility demands:

- Network Infrastructure – Wireless capacity must be able to support both high density (many devices close together) and high bandwidth (e.g. video) usage simultaneously across an entire campus. Network backbones must be adequate to support voluminous aggregated traffic from the classroom to the cloud. The early generations of fiber optic cable installed in schools are proving inadequate for the current and future bandwidth demands of voracious, multiplying mobile devices. As instructional, administrative, and life/safety functions increasingly rely on network availability, power protection for the network becomes more critical.
- Power – While the plug load of mobile devices is negligible compared to desktop computers, they do require periodic charging. Classrooms and shared spaces alike would benefit from student-accessible charging areas with multiple outlets.
- Secure Storage – Devices that don’t go home with students must be secured after school hours. As digital content replaces print curriculum in intermediate and secondary classrooms, device and accessory storage may replace textbook storage.

- **Distance Learning**

Blended learning and online courses have been embraced in higher education and adoption in K-12 is emerging. Online learning opportunities represent a spectrum from watching an instructional YouTube or Khan Academy video to a teacher-led, fully synchronous, video-enabled virtual classroom with infinite permutations in between.

Previous generations of video-enabled distance learning required expensive equipment, dedicated telecommunications lines and copious technical support. Skype and FaceTime now provide inexpensive and widely available remote interaction, and numerous commercial services provide webinar-type live sessions. Strong, low-latency networks with plentiful bandwidth are required for live video interaction, but use of these tools is increasingly commonplace.

Fully online courses are currently hindered by K-12 funding models based on physical attendance. However a number of charter schools are leveraging technology to provide curriculum and virtual learning experiences, both in asynchronous and blended models. Virtual schools and online-supported home schools are an increasingly viable option and have already begun to lure families away from the

District in significant numbers.

Once legal obstacles have been removed it may be feasible for school Districts to offer fully online, synchronous or even asynchronous courses to their students. Coupled with the potential for college-style courses that don't meet daily, this could significantly reduce the need for classroom facilities at the secondary level. The District's Academic Acceleration and Recovery Centers have operated on alternative schedules and calendars for several years, supporting more students per classroom than traditional paradigms.

A high school with a non-traditional schedule may have students with open periods in their schedules, as is typical with college students. In these scenarios students need places on campus to hang out and work productively, either individually or in groups, between classes. These spaces will require multiple seating options, robust Wi-Fi, access to electrical outlets for device charging, and access to the same collaboration technologies they have in their classrooms.

- **Support Services**

The District's ambitious Oceanside Promise initiative aims to address not only the academic needs of our students, but their social/emotional needs and the needs of their families as well. At the same time, the District provides an increasing array of services to our students with special needs. With the increase of both District staff and staff of the District's community partners, there is increasing demand for office and small group interaction space on our campuses. Many staff members need isolated space to work one on one with students either to reduce distractions or to protect student privacy. While classrooms double as meeting spaces after school, during the school day meeting space can be hard to find.

For staff who only occasionally need private space, establishing office space clusters with a shared private conference room would be more cost-effective than attempting to provide private spaces for every staff member. School designs should be re-programmed to account for the increase in staff and pseudo-staff present on our campuses.

Working spaces for itinerant staff and non-clerical support staff should not be neglected. Administrative spaces for custodians should be provided. Technical support staff need space to work and store equipment as well as occasional access to secure pre-deployment or re-deployment equipment staging areas.

Facility Objectives

- **Flexibility**

We are at a time of dynamic change in public education, with technology disrupting traditional instructional practices and providing intriguing opportunities. We would be naïve to think that we know precisely how we'll want to use our classrooms 15 or 20 years from now. The pragmatic response to such uncertainty is to create learning spaces that can be configured to accommodate a range of instructional modes. Classroom design should be pedagogy-agnostic, supporting the full gamut of learning modes without presuming a particular preference.

In practice this will result in a less built-in cabinetry in classrooms so that teachers rather than designers will be making decisions about room configuration. Furniture that can quickly be moved by students will accommodate rapid shifts between learning modes during class. Multi-function walls are appropriate when they are able to support instructional materials or can be written or projected upon thus enabling teachers to make any wall into the "front" of the room for direct, whole class instruction. Some built-in cabinetry will be necessary for storage and to support sinks but cabinetry should have multi-functional surfaces where feasible.

Building services like lighting and user-accessible power and lighting should support flexible room configuration. Power and data outlets should be available at multiple points on each wall as well as in at least one accessible ceiling location.

Lifetime expectancies for school buildings are long; it is typically 25 years or more from a school's original construction before it will be modernized, and even longer before it will be replaced. The ability to modify buildings inexpensively to suit future needs can prolong the useful life of school buildings. Designing for future capacity and location expansion in power, signal, and plumbing infrastructure can help future-proof buildings, facilitating less expensive solutions for future, unknown needs.

- **Extended Classrooms**

With students working individually and in small groups, a classroom that can be extended beyond the customary four walls provides additional flexibility. This can be accomplished with visual and/or physical access to nearby secure spaces so that students can be outside the classroom but still under the teacher's supervision. These could be fenced outdoor areas, enclosed courtyards, or internal circulation spaces.

Schools have experimented with accordion walls and other solutions for subdividing space for many years. There are tradeoffs for the flexibility afforded by moveable walls, however. Wall finishes are often limited and infrastructure services (power, data, water, storage) cannot be provided on mobile walls. These tradeoffs might be more acceptable for a single classroom wall if that wall met the other desired criteria like having a writeable surface. A moveable wall made of glass, for example, could provide visibility to another space and be written upon with dry erase markers.

Managing sound is a key consideration for classroom design. Extended classrooms must still be able to mitigate outdoor noise and prevent their own noisy activities from disturbing their neighbors. One advantage of the extended classroom is the ability to separate activities requiring quiet from more active learning modes.

- **Shared Spaces**

Extended classrooms benefit from adjacent secure spaces that allow groups of students to spread out to accommodate simultaneous, diverse learning activities. These can be outside spaces adjacent to classrooms that are fenced or enclosed by buildings. Interior spaces can serve for circulation and as extended classroom space as well.

The trend towards authentic learning has increased demand for shared spaces with finishes and services appropriate for messy, hands-on, project-building. "Makerlabs" are part art room, part woodshop, and part tech lab. With more rugged classrooms or access to secure outdoor learning spaces, the demand for dedicated making spaces could diminish, but it seems likely that demand for this type of specialized space will persist and even grow as the authenticity trend builds momentum.

The trend towards increased collaboration extends to the adults in a school as well. Classrooms double as meeting rooms after school hours, but during school hours there is an increasing need for meeting spaces for small groups. These spaces require the same collaboration features as in classrooms.

Private settings for one-on-one instruction (e.g. speech therapy) or counseling are increasingly in demand. In schools without small office spaces, at times entire classrooms are dedicated for this purpose, some occupied by a single service provider. This represents an inefficient use of space that could be prevented by providing additional small offices.

- **Outdoor Learning Spaces**

Oceanside enjoys an ideal climate with prevailing onshore winds from the Pacific Ocean typically moderating temperatures within a comfortable range. Unlike in many parts of the country, it's practical to be outdoors most days in this area. This provides an opportunity to take learning activities outside, either in areas immediately adjacent to classrooms or in other areas of campus designed for this purpose.

One visible manifestation of the authenticity trend on campuses is the prevalence of gardens as learning laboratories. In addition to the link to science curriculum, students learn where food comes from and all aspects of agriculture. Some campuses have obvious garden locations but others have less suitable options. Ideally gardens should be located on level grades away from classrooms with access to water and power. Fenced locations with securable access from off campus facilitate community gardens. Care should be taken to preserve the "curb appeal" of campuses by locating gardens in rear areas of campuses or in areas shielded by building from public view.

The District has greenhouses on a few campuses and anticipates additional requests as funding allows and associated instructional programs mature. Greenhouses suitable for occupation by students must be safe and accessible and require water, power, and appropriate drainage. Locations for future potential greenhouses should be identified during campus design.

In recent years there has been increased concern about protecting students from excessive sun exposure when they're outdoors. Trees require periodic maintenance but can provide excellent shade and mitigate the sterility of modern school facilities. Fabricated shade structures require less maintenance than trees but can't require decades to provide shade and are available in a wide range of materials and configurations.

Some schools have improvised outdoor classrooms in their garden areas, with mixed results. Providing for these areas in campus design will allow for provision of proper access, drainage, shade, and security. Outdoor classrooms can be as simple as benches or even rocks or log sections secured under shade trees. Many schools have interstitial spaces between classroom wings that are often landscaped or planted with ornamental landscaping. Equipped with seating walls and/or concrete

tables and shade, these areas represent opportunities for extended classroom spaces.

- **Maintainability**

In California, capital funds for improving school facilities are separate from funds for school operations. With operational funds perpetually scarce, building school facilities that are inexpensive to maintain is a high priority. The challenge for designers is to create productive schools with attractive learning spaces that are durable and low-maintenance.

Implementing standard finishes, fixtures and building systems across multiple projects can reduce maintenance costs and complexity and simplify decision-making in the design process. Standards allow maintenance personnel to stock replacement components and materials, speeding repair work.

Selecting durable, low-maintenance finishes helps stretch limited custodial resources and ensure that learning spaces are always clean and ready for student use. Rooms serving our youngest students and spaces designated for messy activities, like makerspaces or science labs require particular attention to finishes.

Standardizing on particular types or brands of building systems like HVAC equipment, paging systems, or security systems can streamline building maintenance. Highly proprietary systems present significant risks if manufacturers disappear or are taken over by competitors. Open systems based on industry standards mitigate risk and are most likely to be supportable in future years.

- **Sustainability**

In recent years sustainability has been linked to green initiatives and practices. The District is certainly interested in reducing its carbon footprint, but it is also interested in reducing operational expenses to free up resources for its core business of teaching and learning. Building durable, high-quality facilities reduces wasteful re-construction and lengthens the useful lifetime of our campuses. Investing our capital resources to reduce future operational expenses is a prudent use of limited funds.

The District is working actively to reduce its energy usage. A behavior-based energy saving program has shown promising results in reducing waste by ensuring that energy-consuming devices are turned off when not in use. Proposition 39, approved by California voters in 2012, has provided funding for HVAC and lighting upgrades that will further reduce energy usage.

While only a few years ago LED lighting was difficult to cost-justify due to high initial costs, efficiency improvements and market-driven cost reductions have changed that thinking. With even further efficiency improvements and cost reductions expected, LED lighting will be standard everywhere. Dimmable LED lights simplify Title 24 compliance and are now available in the full gamut of brightness and color temperature. LED lights have the added advantage of reducing or eliminating lamp and ballast replacement, saving valuable time for custodial and maintenance staff.

The District has implemented explicit daylight harvesting strategies in many of its buildings, installing its first solar tubes as early as 2004. Dimmable LEDs and Title 24 compliant lighting controls will maximize savings from daylight capture by lighting spaces only as needed.

While Oceanside's ideal climate keeps HVAC-related energy costs relatively low, they still constitute the lion's share of the District's energy bills. In recent years the District has provided individual HVAC systems for each classroom. In our experience, the nominal efficiencies presented by package units serving multiple rooms are typically offset by the need to run them longer to accommodate the varied needs of the building's occupants. While the District is committed to providing occupants control of their environment, implementing smart thermostats that could be globally controlled by support technicians would further increase efficiencies and provide better service for occupants.

The state has an ambitious goal of making half of all government buildings, including schools, Zero Net Energy facilities by 2030. While still just a goal, this initiative is likely to transform into guidelines and eventually regulations. Efforts to reduce energy consumption in HVAC, lighting, and plug load will certainly help, but achieving zero net energy requires on-site energy generation. At this time solar is the only technology capable of providing sufficient energy to power a school site, and many schools have implemented solar energy systems. Most school solar consists of freestanding panels, often mounted over parking lots. Such systems placed in playgrounds or near classroom buildings could double as shade covers.

While solar has been growing in popularity for the last decade, in more recent years it is increasingly being paired with energy storage technology. The power generation profile of solar panels correlates well to the energy usage curve of schools throughout the day, but there are periods of high energy use outside of peak solar generation hours. Battery storage can bridge the gaps, providing a reliable energy source around the clock. The ability to store energy also allows owners to avoid the exorbitant charges associated with high power demand episodes, a practice known as peak shaving.

- **Safety and Security**

The safety and well-being of our students and staff is always a top priority for the District. Recent concern about school shootings and intruders on campuses has prompted an effort to enhance security at our schools. School personnel need to be able to control access to classroom and play areas during school hours, preferably through a single point of access at the school office. Schools have expressed interest in technology-based solutions for tracking visitors while on campus.

The District recognizes that during non-school hours, our campuses represent important community resources, serving as de facto parks and playgrounds. However, uncontrolled access to classroom areas increases opportunities for vandalism and theft. Whenever feasible, classroom and administrative areas of campuses should be fenced off from playgrounds and field areas so that buildings can be secured after hours. Care must be taken to ensure that gates are sized appropriately to support rapid student egress from classroom areas to evacuation areas during emergencies.

While schools still conduct required fire drills to practice evacuation procedures, preventing and responding to active shooter scenarios is increasingly the focus of school safety efforts. Buildings that can be locked down quickly and without exposing occupants to danger provide peace of mind to students, staff, and parents. Windows that face unsecured areas should be placed high enough to prevent visibility into classrooms or include features that allow occupants to quickly prevent visibility from outside.

			Food Service addition				
			New axillary gymnasium				
		CS rooms					
		Advanced MFG. rooms					
		Bio MFG. rooms					
		2-3 think bit style labs					
		Other					
		Modernize gymnasium facility					
Oceanside High		Health and Safety					
	1	Improve access for parking	10	5	15		
		Classroom Modernization					
		Full Modernization					
		Support Facilities					
	2	Patio furniture in lunch area	1		1		
	3	Improve strength and accessibility of Wi-Fi					
	4	Update heating and cooling school wide					
	5	Updated classroom furniture					
		Athletic Facilities					
		Gym roof windows above ceiling and scuppers need replacing					
		Exterior walls need to be sealed to prevent moisture					
		Site Modernization					
		Chiller and boiler need replacing in Science and Tech bldg.					
		Replace gutters					
		Replace carpet as needed/necessary					
		Exterior walls need painting					
		Technology					
		Robust cable, dense Wi-Fi, video, surveillance, fiber sway if needed					
		Dense wi-fi plan for two Cat6 cables in on location in every room					
	Video surveillance camera drop locations						
	Hardware, pathways, power and signal for ceiling-mounted projectors						
	Swap out fiber if necessary						

School	Priority	Need	Blue Dots	Red Dots	Total Dots	Notes	
Ocean Shores		Healthy and Safety					
		Basket ball court is in the lunch area					
		Stairs near lunch window too steep and not deep enough					
		Classroom can reach 100 degrees (no AC)					
		Classrooms with wall of glass windows					
		Water fountain improvement					
		Kiln with asbestos removed					
		OSHS at max capacity is unsafe					
	1	Full Modernization, for disability issues			6	6	
		Full school wide rewire to support AC and PA/Technology	12	9	21		
	2	Classroom modernizations					
		Air conditioning					
		PA system fixed					
		Cameras (security)					
		New window (safety issue)					
		Drain lines replaced					
		Out dated classroom layout (not conducive to 21st century learning					
		Electric re-wiring (complete)					
		Support Facilities					
		New health center					
		Revamp nutrition services spaces (closet)					
		Centralized storage for custodial (now 3 closets)					
		Designated counseling/group space					
		Library/tech					
		Security Office/booth					
		Athletic Facilities					
		Weight room					
		Playing field					
		Storage for sports					
		Multipurpose room					
		Site Modernization					
		Replace gutters					
		Replace carpet as needed/necessary					
	3	Outdoor student area lunch area/recreation area					
	4	Security Improvements of new windows, doors, alarms on all buildings					
	5	Accessibility, concrete/stairs					
		Technology					
		Robust cable, dense Wi-Fi, video, surveillance, fiber sway if needed					
		Dense wi-fi plan for two Cat6 cables in on location in every room					
		Security booth					
	Video surveillance camera drop locations						
	Hardware, pathways, power and signal for ceiling-mounted projectors						
	Swap out fiber if necessary						
	New Construction						
	More acreage (We are at capacity)						
	Multipurpose						
	Internet Café						
	Greenhouse						
Burgener		N/A					

School	Priority	Need	Blue Dots	Red Dots	Total Dots	Notes
Ditmar		N/A				
DO North & South	1	Combine DO North and South, instructional, Fiscal, Payroll and HR				No dot exercise
		Multi story, energy and efficient				No number 4 or 5
		New construction and parking on Southside				
		Boardroom, conference rooms 4				
	2	Parking on North side (ESS)				
	3	New Warehouse & Nutrition Services				
		MO plus transportation				
		Northside				
	Pedestrian access across Mission Avenue

Individual	\$15,000,839
Cumulative	\$65,861,574
Individual	\$80,813
Cumulative	\$65,942,387

ASSUMPTIONS:

- There is no available state funding through the SFP
- The remaining authorization through Prop H of \$65,005,674 is split into Series E, R, F and minimized the funding shortfall
- Design work is assumed to begin in 2017 and has been estimated at 6.5% of project costs using 2017 cost figures
- The costs indicated in the 2019 priority column were calculated by subtracting 2017 design cost estimates from the 2019 escalated cost values
